But the mere fact that a debtor having ample assets is unable in an emergency to pay every existing obligation as it becomes due, is not regarded as *insolvency* if he is able to avoid making any actual default by obtaining further credit, or if the exigency is a general panic suspending all business, and his suspension of payment is temporary and terminates with the restoration of a reasonable degree of general confidence.

The term is often defined as extending only to laws which do this at the application of the debtor. In the United States the term has recently become extended to cover State laws which release the debtor at the application of either party, in contradistinction to the United States or national bankruptcy laws, which, wherever in force, suspend the State laws to a considerable extent. See *bankruptcy laws*, under *bankruptcy*.

3. In *theol.*, an influence directly and immediately exerted by the Spirit of God upon the soul of man: in Christian theology, used especially with reference to the Old and New Testaments, regarded as written under the direct influence of God exercised upon the thoughts and feelings of the writers. This doctrine of the inspiration of the Scriptures has been maintained in various forms, and with various definitions of the nature and extent of the divine influence, the principal being the following: (a) *verbal inspiration*, the immediate communication or dictation to the writers of every word written; (b) *plenary inspiration*, inspiration which is full, complete, entire: involving the doctrine that the Bible was inspired in all its parts and the writers in all their faculties, so that every statement of the inspired writers, whether moral and religious, or only chronological or scientific, is to be accepted as true and authoritative; (c) *moral inspiration*, inspiration only for a definite purpose, namely, the moral and spiritual redemption and development of the race, so that the Bible is to be accepted as authoritative only in matters of religious faith and practice; (d) *dynamical inspiration*, inspiration regarded as acting upon and through the natural faculties: in contrast to (e) *mechanical inspiration*, inspiration regarded as an influence which merely uses human organs as an instrument for expression. Thus, *dynamical* inspiration is nearly equivalent to *moral* inspiration, the one word indicating, however, rather the method employed, the other the themes to which inspiration is supposed to be limited; while *mechanical* inspiration is nearly synonymous with *verbal* inspiration.

All scripture is given by *inspiration* of God, and is profitable for doctrine, for reproof, for correction, for instruction in righteousness. [In Wyclif, "All scripture of God ynspired is profitable," etc.; in the revised version, "Every scripture inspired of God is also profitable," etc.] 2 Tim. iii. 16.

Inspiration then, according to its manifestation in Scripture, is *Dynamical* and not *Mechanical*: the human powers of the divine messenger act according to their natural laws, even when these powers are supernaturally strengthened. Man is not converted into a mere machine, even in the hand of God.

A special innate propensity, in any organized being, but more especially in the lower animals, producing effects which appear to be those of reason and knowledge, but which transcend the general intelligence or experience of the creature; the sagacity of brutes. Instinct is said to be blind—that is, either the end is not consciously recognized by the animal, or the connection of the means with the end is not understood. Instinct is also, in general, somewhat deficient in instant adaptability to extraordinary circumstances.

Shak., 1 Hen. IV., ii. 4, 299.

Habit differs from *instinct*, not in its nature, but in its origin; the last being natural, the first acquired. *Acid*.

It will be universally admitted that *instincts* are as important as corporeal structures for the welfare of each species under its present conditions of life. Under changed conditions of life it is at least possible that slight modifi-

cations of *instinct* might be profitable to a species; and if it can be shown that *instincts* do vary ever so little, then I can see no difficulty in natural selection preserving and continually accumulating variations of *instinct* to any extent that was profitable. It is thus, as I believe, that all the most complex and wonderful *instincts* have originated.

Darwin, *Origin of Species* (1859), p. 137.

Instinct is purposive action without consciousness of the purpose. . . . The end to which a definite kind of instinctive action is subservient is not conceived once for all by a mind standing outside the individual like a providence, and the necessity to act conformably thereto externally thrust upon the individual as something foreign to him; but the end of the *instinct* is in each single case unconsciously willed and imagined by the individual, and the choice of means suitable to each special case unconsciously made.

E. von Hartmann, *Philosophy of the Unconscious*, tr. by [Coupland, A. iii.]

Every animal that has well-developed eyes presents an instance of the adaptation of means to purpose by unconscious formative intelligence, which is quite as definite as that shown in any motor *instinct*, and far more delicate and subtle.

Murphy, *Habit and Intelligence*, xxvii.

All *instincts* probably arose in one or other of two ways. (1) By the effects of habit in successive generations, mental activities which were originally intelligent become, as it were, stereotyped into permanent *instincts*. . . . (2) The other mode of origin consists in natural selection, or survival of the fittest, continuously preserving actions which, although never intelligent, yet happen to have been of benefit.

8. *Eccles.*: (a) (1) The origination of the eucharist, and enactment of its observance, by Christ. (2) The words used by Christ in instituting the eucharist, in various forms as recorded in Scripture (Mat. xxvi. 26–28; Mark xiv. 22–24; Luke xxii. 19, 20; 1 Cor. xi. 23–25), or transmitted by tradition; in *liturgies*, the part of the prayer of consecration of the eucharistic elements in which these words are repeated. Also called more fully the *commemoration, recital, or words of institution*. In its fullest form, as exemplified in Oriental *liturgies*, in the Scotch communion office of 1764, and in the American Prayer-book, the prayer of consecration consists of three principal parts, the institution, oblation, and epiclesis or invocation. In nearly all the older *liturgies* (except the Roman) the institution seems principally conceived in the character of a recital of Christ's words and actions at the last supper, the great oblation and epiclesis consummating the observance commanded by him; while in the Western *liturgies*, including the Roman and that of the Church of England, but excluding the Mozarabic in its original R., nor the Scotch and American offices, the institution, with the

manual acts, is regarded as the full and complete act of consecration, and there is no invocation.

The true Eastern doctrine seems to be that there must be co-operation of the words of *institution* and of the invocation of the Holy Ghost, before the bread and wine become the Body and Blood of Christ.

J. M. Neale, *Eastern Church*, i. 485.

(b) The act by which a bishop commits the cure of souls under himself in a parish within his diocese to a priest as rector or vicar. In the Church of England the presentee must previously have made the declaration of assent, taken the oaths of allegiance and canonical obedience, and made the declaration against simony. Institution is given by the bishop or his commissary reading an instrument, the seal of which the clergyman being instituted holds, kneeling before him. When the bishop is patron of the benefice, the same act becomes collation instead of institution. After institution induction admits to temporal possession of the goods and income attached to the cure of souls. In the American Episcopal Church induction is not separate from institution, and there is a public office of institution, set forth in 1804 as the office of induction and revised in 1808 and 1886. The bishop, if satisfied that a clergyman is a qualified minister and fully elected, may act as institutor himself or appoint a presbyter to act in his stead. The office consists in reading the letter of institution, presentation by the senior warden or other vestryman of the keys of the church to the new incumbent, his reception within the altar-rails by the institutor, who presents him with the Bible, Prayer-book, and books of canons, and in the use of proper psalms, lessons, anthem, and prayers, after which the instituted minister offers special prayers, and, after a sermon, celebrates the holy communion.—*Literary and Scientific Institutions Act*, an English statute of 1854 (17 and 18 Vict., c. 112) which authorizes the gift or sale of land (not more than one acre) to institutions established for the promotion of science, literature, art, etc.

The Journal of the Franklin Institute observes the method of *insufflation* and evaporation referred to is simply the blowing of streams of air, not necessarily heated, into a liquid warmed by some usual means to some desired temperature, which may or may not be the boiling point of the liquid. Ure, Dict., IV. 850.

A medical instrument for blowing air, or a gas, vapor, or powder, into some opening of the body. See *insufflation*, 3.

3. In *elect.* and *thermotics*, to separate, as an electrified or heated body, from other bodies by the interposition of a non-conductor; more specifically, in the case of electricity, to separate from the earth (since an electrified body tends to part with its electricity to the earth). This is accomplished by supporting the body by means of silk, glass, resin, or some other non-conductor, or surrounding it with such materials. *See insulator.* Also *isolate*.

4. In *chem.*, to free from combination with other substances.

The figures show the usual forms of insulators employed in telegraph-lines to support the wire on the post. They are frequently made of porcelain or glass, and in the shape of an inverted cup, round which the wire is wrapped or is attached by a hook depending from it, or the like. In the case of electricity the commonest insulators for supports are glass, porcelain, and vulcanized rubber; and for covering wires conveying currents, silk, cotton, gutta-percha, and rubber. These substances do not absolutely prevent the communication of electricity, but a good glass Leyden jar, for example, will hold a charge for months. No perfect insulator for either electricity or heat is known, and the distinction between conductors and insulators is somewhat arbitrary.

A, glass insulator used on Western Union lines, usually supported by an oak stalk. *B*, double-cup insulator used on English lines: *a, c*, cups of brown earthenware; *b*, an iron stalk by means of which the insulator is fixed to the cross-arm of the telegraph-pole.

The act of insuring or assuring against loss; a system of business by which a company or corporation (called an *insurance company*, or, rarely, *assurance company* or *society*) guarantees the insured to a specified extent and under stipulated conditions against pecuniary loss arising from such contingencies as loss of or damage to property by fire or the efforts to extinguish fire (fire-insurance), or by shipwreck or disaster at sea (marine insurance), or by explosion, breakage, or other accidents to property, or the loss of future earnings, either through disablement (accident-insurance) or through death (life-insurance), etc. Also called *assurance*. Specifically—2. In law, a contract by which one party, for an agreed consideration (which is proportioned

to the risk involved), undertakes to compensate the other for loss on a specified thing, from specified causes. The party agreeing to make the compensation is usually called the *insurer* or *underwriter*; the other the *insured* or *assured*, the agreed consideration the *premium*, the written contract a *policy*, the events insured against *risks* or *perils*, and the subject, right, or interest to be protected the *insurable interest*. *Bouvier*.

Agreement for insurance. See *agreement*.—**Co-insurance**, insurance in which two or more parties are jointly responsible for any loss which may come upon certain specified property; specifically, a form of insurance in which the insured, in consideration of a reduced rate of premium, agrees to maintain insurance upon his property to a certain specified extent, say 80 per cent. of its actual cash value, and failing to do so becomes his own insurer for the difference, and in case of partial loss is jointly responsible with the insurance company in that proportion.—**Graveyard insurance**, a method of swindling insurance companies by means of insurance effected on the life of a very old or infirm person, who, through collusion with the medical examiner, may be personated by one of robust health, or otherwise falsely passed upon.—**Hazardous insurance**. See *hazardous*.—**Insurance broker**, one whose business it is to procure insurance for other persons, or to act as broker between owners of property and insurance companies.—**Insurance commissioner**, in some of the United States, a State officer who in behalf of the public maintains a supervision over the affairs of insurance companies.—**Insurance company**, a company or corporation whose business is to insure against loss or damage.—**Insurance policy**. See *def.* 2, above.—**Syn.** *Assurance*, *Insurance*. See the extract.

The terms *insurance* and *assurance* have been used indiscriminately for contracts relative to life, fire, and shipping. As custom has rather more frequently employed the latter term for those relative to life, I have in this volume entirely restricted the word *assurance* to that sense. If this distinction be admitted, *assurance* will signify a contract dependent on the duration of life, which must either happen or fail, and *insurance* will mean a contract relating to any other uncertain event, which may partly happen or partly fail.

Babbage, Comparative View of Institutions for Assurance
[of Lives (1826), quoted in *Encyc. Brit.*, XIII. 169.]

[The distinction here made has not become established, although it is observed to some extent, especially in Great Britain.]

Cf. *assure*, which is earlier.] **I. trans.** 1. To make sure, certain, or secure; give assurance of: assure: as, to insure safety to any one.

The knyght *ensured* hym his feith to do in this maner.

=**Syn.** *Insure*, *Assure*. *Assure* may express the making certain in mind: as, I was *assured* of safety by his friendly manner; *insure* has not this sense. *Insure* is a possible word to express the making certain in fact, and is more common than *ensure*: as, his lack of money *insured* his early return; *assure* has not this sense. *Insure* and *assure* are both used of the act of pledging a payment of money upon loss or death, but *assure* is rarely used in that sense in the United States.

2. One who contracts, in consideration of a stipulated payment called a *premium*, to in-

demnify a person or company against certain perils or losses, or against a particular event; an underwriter.

That the chance of loss is frequently undervalued, and scarce ever valued more than it is worth, we may learn from the very moderate profit of *insurers*.

Adam Smith, Wealth of Nations, i. 10.

II. trans. To stir up to insurrection. [*Rare.*]

The news of the dispute between England and Spain about Nootka Sound in 1790 recalled him [Miranda] to England, where he saw a good deal of Pitt, who had determined to make use of him to *insurge* the Spanish colonies, but the peaceful arrangement of the dispute again destroyed his hopes.
Encyc. Brit., XVI. 498.

To advance is the only safety of *insurgents*.
R. W. Dixon, Hist. Church of Eng., xv.

=**Syn.** *Insurgent*, *Rebel*, *Traitor*. An *insurgent* differs from a *rebel* chiefly in degree. The *insurgent* opposes the execution of a particular law or scheme of laws, or the carrying out of some particular measure, or he wishes to make a demonstration in favor of some measure or to express discontent; the *rebel* attempts to overthrow or change the government, or he revolts and attempts to place his country under another jurisdiction. A *traitor* is one who breaks faith or trust by betraying his country or violating his allegiance, especially a sworn allegiance: the word is applied in strong reprobation to one who, even without express breach of faith, makes war upon his sovereign or country, or goes over from the side to which his loyalty is due. See *insurrection*.

Whisky Insurrection or Rebellion, an outbreak in Pennsylvania in 1794 against the enforcement of an act of Congress of 1791 imposing an excise duty on all spirits distilled within the United States. A large body of militia was sent to the disturbed district, but the insurrection was suppressed without bloodshed.—**Syn.** 2. *Insurrection*, *Sedition*, *Rebellion*, *Revolt*, *Mutiny*. The first five words are distinguished from the last in that they express action directed against government or authority, while *riot* has this implication only incidentally if at all. They express actual and open resistance to authority, except *sedition*, which may be secret or open, and often is only of a nature to lead to overt acts. An *insurrection* goes beyond *sedition* in that it is an actual rising against the government in discontent, in resistance to a law, or the like. (See *insurgent*, *n.*) *Rebellion* goes beyond *insurrection* in aim, being an attempt actually to overthrow the government, while an *insurrection* seeks only some change of minor importance. A *rebellion* is generally on a larger scale than an *insurrection*. A *revolt* has generally the same aim as a *rebellion*, but is on a smaller scale. A *revolt* may be against military government, but is generally, like *insurrection*, *sedition*, and *rebellion*, against civil government. A *mutiny* is organized resistance to law in an army or navy, or sometimes a similar act by an individual. All these words have figurative uses. When literally used, only *insurrection* and *revolt* may be employed in a good sense. The success of a *rebellion* often dignifies it with the name of a *revolution*. A *riot* is generally a blind and unguided outburst of fury, with violence to property and often to persons: as, the draft-riots in New York city in 1863.

insurrectional (in-su-rek'shon-al), *a.* [= F. *insurrectionnel* = Sp. *insurreccional*; as *insurrection* + -al.] Of or pertaining to insurrection; consisting in insurrection.

The plate is first coated with zinc oxide rendered very uniform and smooth by hydraulic pressure. Upon this surface the design is traced with an oily ink. The coating is then washed with a solution of zinc chloride, the effect of which upon the parts not protected by the ink is to harden them, leaving the parts under the ink-tracings in a friable condition. When these friable parts are removed by brushes or other implements, the design is left in *intaglio*. From the plate so prepared stereotype or electrolyte plates are obtained for use in printing. Other solutions are sometimes substituted for the zinc chloride.

Relating to a whole composed of parts spatially distinct (as a human body of head, trunk, and limbs), or of distinct units (as a number).

The *integrals* parts inake pericte the whole, and cause the bigness thereof. Sir T. Wilson, Rule of Reason (1552).

A local motion keepeth bodies *integral* and their parts together.

Bacon, Nat. Hist.

An *integral* whole is that which has part out of part. Parts *integral*, because each is endued with his proper quantity, not only differ in themselves, but also in site, or at least order; so that one is not contained in another. For this it is to have part out of part. . . . This whole is termed mathematical, because quantity is of mathematical consideration: vulgarly, *integral*.

Burgersdicius, tr. by a Gentleman, *Monitio Logica*,

[I. xiv. 12.]

Whole *integral* is that which consisteth of *integral* parts, which though they cleave together yet they are distinct and several in number, as mans body, consisting of head, breast, belly, legs, etc.

Blumdeville, *Arts of Logique*.

Hence, and by a reversion to the classical meaning of *integer*—2. Unmained; unimpaired.

3. *Intrinsic*; belonging as a part to the whole, and not a mere appendage to it.

It is a little uncertain whether the groups of figures at either end of the verandah are *integral*, or whether they may not have been added at some subsequent period.

All the Teutonic states in Britain became first dependencies of the West-Saxon king, then *integral* parts of his kingdom.

E. A. Freeman, *Amer. Lects.*, p. 185.

4. In *math.*: (a) *Of*, pertaining to, or being a whole number or undivided quantity. (b) Pertaining to or proceeding by integration: as, the *integral* method.—**Integral calculus**, a branch of the infinitesimal or differential calculus, which is partly the inverse of the pure differential calculus in the narrower sense. The *integral* calculus is sometimes taken to include the solution of differential equations, and in that case a comprehensive definition of it can be given: namely, it is the complete discussion of differential equations. So considered, it has the theory of functions as its groundwork. But the subject of differential equations is sometimes excluded from the *integral* calculus; and then the latter is left without any clear unity, including the finding and discussion of integrals, a part of the theory of functions, the theory of spherical harmonics, the theory of residuation, etc. The *integral* calculus is distinguished from the differential calculus in the narrow sense by the far greater importance in it of imaginaries. Compare *calculus*, 3.—**Integral curvature**, function, etc. See the nouns.

II. n. 1. An *integral* whole; a whole formed of parts spatially distinct, or of numerical parts.—2t. An *integral* part.

They all make up a most magnificent and stately temple, and every *integral* thereof full of wonder.

Sir M. Hale, *Orig. of Mankind*, p. 372.

3. In *math.*, the result of integration, or the operation inverse to differentiation. An *integral* is either the *integral* of a quantity or the *integral* of an equation; and the latter phrase has two senses. (a) The *integral* of a function is relative to an independent variable, and is taken between limits, which, however, may remain indefinite. A *definite integral* is conceived as resulting from the multiplication of each value of the function by the corresponding value of the differential of the independent variable, as this variable passes through a continuous series of values from one of the limits, called the *first*, *lower*, or *inferior*, to the other, called the *second*, *upper*, or *superior*, followed by the addition of all the infinitesimal products so obtained. Suppose, for example, that the value of a quantity *y* depends upon that of another quantity *x*, so that *y* = *Fx*, where *F* signifies some operation performed on *x*; then, measuring off *x* and *y*, upon the axes of a system of two rectangular coordinates, we shall get a plane curve. (See the figure.) Let *Ox* and *Oy* be the axes of *x* and *y* respectively. Let *A* be the point for which *x* = *a*, *y* = 0; and *B* the point for which *x* = *b*, *y* = 0. Let *P* be the point for which *x* = *a*, while *y* = *Fa*; and let *Q* be the point for which *x* = *b*, while *y* = *Fb*. Then conceive the whole space *APQB* to be filled up with lines parallel to the axis of *Y*, at infinitesimal distances from one another. Then *ydx* will measure the infinitesimal area between two of these lines, the axis of abscissas and the curve; and the sum of all such infinitesimals, or the *integral* of *y* relatively to *x* from *x* = *a* to *x* = *b*, written $\int_a^b ydx$, will measure the whole area *APQB*.

It is to be understood that we never pass from one limit to the other through infinity; but if the first limit is greater than the second, the sign of the definite *integral* is reversed. This gives a distinct idea of a definite *integral*, in case the variable is real. If the variable is imaginary, the definite *integral* is still conceived as the sum of all the values of *ydx* from one limit to the other; only there is in this case an infinite variety of different paths by which the variable can pass from one limit to the other. It is found, however, that in the plane of the imaginary variable there are generally certain points such that integration round one of them in a closed contour gives a constant value not zero, and but for that the path of integration does not affect the result, for all ordinary functions. An *indefinite integral* is a function of the independent variable with an arbitrary constant *c* wholly indeterminate constant added to it, and such that its value for one value of the independent variable is sub-

tracted from another, the difference is the definite integral from the first value of the independent variable to the second. If A is the indefinite integral of B relative to C, then also B is the differential coefficient of A relative to C. (b) An integral of a differential equation or system of such equations is a system of a lower order (it may be a single equation, and it may be one or more ordinary equations) from which the first system is deducible. If the order of the second system is lower than the first by one, the former is a *first integral*; if by two, a *second integral*, etc. A *complete integral* is one which contains the greatest possible number of arbitrary constants for an integral of that order. A *singular integral* is one which contains a smaller number of arbitrary constants, but is not a particular case of any irreducible complete integral. A *general integral* is one which contains the greatest possible number of arbitrary functions; but the complete integral of an ordinary differential equation is also termed a general integral. A *particular integral* is a particular case of a complete integral having a smaller number of arbitrary constants. (c) A quantity or expression which a system of differential equations makes to be constant is also termed an integral of that system.—**Abelian integral.** See *Abelian*.—**Circular integral,** an integral taken round a circle in the plane of the imaginary variable, any pole of the function being the center.—**Closed integral,** an imaginary integral whose upper and lower limits coincide, a circuit being described by the variable in the course of the integration.—**Complete integral.** See *complete*.—**Cosine integral.** See *cosine*.—**Dirichletian integral,** an integral of the form

$$\int_0^a \Phi(x, h) dx,$$

$$\int_0^h \int_0^a \frac{\partial}{\partial x} \phi(x, y) dx,$$

which, after the performance of the integration relatively to y , becomes a Dirichletian integral. **Hyperelliptic, imaginary, etc. integral.** See the adjectives.—**Integral of the first kind,** an Abelian integral for which the second member of Abel's formula vanishes.—**Integral of the second kind,** an Abelian integral for which the second member of Abel's formula is rational.—**Integral of the third kind,** an Abelian integral for which the second member of Abel's formula involves a logarithmic function.—**Irreducible integral,** an integral not a rational integral homogeneous function of integrals of lower degree.—**Linear integral,** an integral along one or more straight lines in the plane of the imaginary variable.—**Line-integral, surface-integral, volume-integral,** having different values at different points of space; the integral obtained by breaking a curve, a surface, or a solid into equal elementary portions, and taking the sum of the products obtained by multiplying each by the value of the quantity integrated at that point.—**Open integral,** an integral whose two limits are unequal.

The act of integrating, or bringing together the parts of an integral whole; the act of segregating and bringing together similar particles.

Integration of parts means the connected play of them, so that, one being affected, the rest are affected.
W. K. Clifford, Lectures, I. 95.

The term *integration* we have already partly defined as the concentration of the material units which go to make up any aggregate. But a complete definition must recognize the fact that, along with the *integration* of wholes, there goes on in all cases in which structural complexity is attained an *integration* of parts. This secondary *integration* may be defined as the segregation, or grouping together, of those units of a heterogeneous aggregate which resemble one another. A good example is afforded by crystallization. . . . *Integration* is seen in the rising of cream upon the surface of a dish of milk, and in the frothy collection of carbonic acid bubbles covering a newly-filled glass of ale.
J. Fiske, Cosmic Philos., I. 336.

2. In *math.*, the operation inverse to differentiation; the operation of finding the integral of a function or of an equation.—3. (obs.) intelecto* = *Pg. intelecto* = *It. intelletto*, < *L. intellectus*, a perceiving, perception, understanding, < *intelligere*, *intelligere*, perceive, understand: see *intelligent*.] 1. The understanding; the sum of all the cognitive faculties except sense, or except sense and imagination. The Latin word *intellectus* was used to translate the Greek *voüs*, which in the theory of Aristotle is the faculty of the cognition of principles, and that which mainly distinguishes man from the beasts. Hence, the psychologists of the Scotch school use *intellect* as the synonym of *common sense*, or the faculty of apprehending a priori principles. The *agent* or *active intellect*, according to Aristotle, is the impersonal intellect that has created the world (see phrase below), the *passive*, *patient*, or *possible intellect* is that which belongs to the individual and perishes with him. But with St. Thomas Aquinas the distinction is quite different, the *possible intellect* being the faculty receptive of the intelligible species emitted by things, while the *agent intellect* is the power of operative thought. The term *pure intellect*, said to be used by St. Augustine, and certainly as early as Scotus Erigena, had always denoted the divine intellect, unmixt with matter, until Kant (adopting, as was his frequent practice, the terminology of Locke) applied it to intellect as separated, in its use or application, from

That can be understood; capable of being apprehended by the intellect or understanding; comprehensible.

If Charles had been the last of his line, there would have been an *intelligible* reason for putting him to death.
Macaulay, Hallam's Const. Hist.

2. In the Kantian philosophy, capable of being apprehended by the understanding only; incapable of being given in sense or applied to it. In the middle ages *intelligible* and *intellecible* were carefully distinguished, the former word having its ordinary present sense, and the latter that of being apprehended only by the intellect acting alone, without the senses. The distinction became later somewhat broken down, and finally Kant introduced the use of *intelligible* defined above.

A real division of objects into phenomena and noumena, and of the world into a sensible and *intelligible* world, is therefore quite inadmissible, although concepts may very well be divided into sensible and *intelligible*. No objects can be assigned to noumena, nor can they be represented as objectively valid. . . . With all this, the concept of a noumenon, if taken as problematical only, remains not only admissible, but, as a concept to limit the sphere of sensibility, indispensable. In this case, however, it is not a purely *intelligible* object for our understanding, but an understanding to which it could belong is itself a problem, if we ask how I could know an object not discursively by means of categories, but intuitively, and yet in a non-sensuous intuition—a process of which we could not understand even the bare possibility. . . . If by purely *intelligible* objects we understand things which, without all schemata of sensibility, are thought by mere categories, such objects are simply impossible.
Kant, Critique of Pure Reason, tr. by Max Müller, II. iii.

Specifically.—2. In *photog.*, the process of thickening or rendering more opaque the chemical deposits in the film of a picture. Intensification is required to improve the printing quality of a negative, when the exposure has been ill-timed or the subject badly lighted. It is sometimes effected, in the case of too short exposure, by carrying the development to an extreme, but more commonly the negative is intensified by a new chemical process after development.

intensifier (in-ten'si-fi-ēr), *n.* One who or that which intensifies. Specifically.—(a) In *photog.*, one of the substances which, when applied to a negative, increase the opacity of the deposit already formed. (b) In physical and mechanical appliances, an apparatus for intensifying or increasing the pressure upon a mass of confined air or other fluid. Two directly connected pistons of different areas, working in separate cylinders supplied with proper valves, constitute the main features of the apparatus. The smaller cylinder receiving the fluid at a given pressure on one side of its piston, the latter is thereby moved to the end of its stroke, and its valve is closed to prevent escape of the fluid. Next, the fluid is, at the same pressure, admitted into the larger

cylinder, on the opposite side of its piston to that upon which the admission was effected in the smaller cylinder. The fluid in the smaller cylinder is thus compressed, and its pressure upon each unit of interior surface of the cylinder is intensified in the exact ratio of the areas of the pistons. By a series of these intensifiers, or by properly proportioning the cylinders and pistons, pressure is thus increased without limit, except such as is introduced by the limits of strength in materials.

This doctrine was held by Duns Scotus and his followers, but was denied by the rest of the scholastic doctors.

See *criminal intent*, below. (b) The tendency imputable by law to an act; the constructive purpose of an action, for which the doer may be responsible, although the actual intent was not wrongful: as when a conveyance is said to be intended to defraud creditors, because, although it may have been without actual dishonest intention, it necessarily has that tendency.—3†. Criminal intent, the intent to do the criminal act or to omit the duty, if the law makes the act or omission an offense, irrespective of whether the person knew of the law, and in many cases irrespective of whether he knew the facts which bring the act or omission within the law, and irrespective of motive. Thus, for example, if a person, whether from the motive of pleasure in the noise, or anger at a cat, discharges a firearm from his window in a city with reckless disregard of human life, and kills a person who is unknown to him, within range, the *criminal intent* is the intelligent purpose to discharge the gun in a highly dangerous manner, as distinguished alike from the motive, from any purpose to violate law, and from any purpose to kill a human being. If he was insane in the legal sense, or if the discharge was accidental, there was no criminal intent; otherwise the intent was criminal, although he had an innocent motive, and was ignorant of the law and of the existence of the bystander.—**Specific intent**, actual intent.—**To all intents and purposes**, in every respect; in all applications or senses; in a looser use, practically; substantially, but not literally.

To all intents and purposes, he who will not open his eyes is for the present as blind as he that cannot.

8. In law, intent; the fixing of the mind upon the act and thinking of it as of one which will be performed when the time comes. *Stephen*; *Harris*. It depends on a joint exercise of the will and the understanding.—9. In *scholastic logic*, a general concept of the mind. [This use of the word (Latin *intentiō*), first found in a translation from Avicenna, was common throughout the thirteenth, fourteenth, and fifteenth centuries. Aquinas says that the intelligible species or first apprehension is the beginning, while the intention is the end of the process of thought.]

—**Declaration of intention**. See *declaration*.—**First intention**, in *logic*, a general conception obtained by abstraction from the ideas or images of sensible objects.—**Second intention**, in *logic*, a general conception obtained by reflection and abstraction applied to first intentions as objects. Thus, the concepts man, animal, and thing are first intentions; but if we reflect that man is a species of animal, and animal a species of organism, we see there is no reason why this process should not be continued until we have a concept embracing every other object or being (ens); and this concept, not obtained by direct abstraction from the species offered by the imagination, but by thinking about words or concepts, is a second intention. In particular, the concepts of a genus, of a species, of a specific difference, of a property, and of an accident were considered to be derived from the consideration of particular genera, species, differences, properties, and accidents, and so to be second intentions per accidens. At the present day such terms as *being*, *nothing*, *identity*, *negation*, and the like are called terms of second intention when it is desired to emphasize the fact that they are obtained by abstraction from the logical relations of other terms.—**Special intention**, the celebration of the eucharist for a specific object. See *Glossary*.—**To heal by first intention**, in *surg.*, to cicatrize without supputation, as a wound.—**To heal by second intention**, in *surg.*, to unite after supputation, as the borders of a wound.

inter² (in-ter'), *prep.* [*L.*, in the midst, between, during, among (in comp. also under, down: see *inter*) (= *Skt. antar*, within), < *in*, in, within, + *-ter*, a compar. suffix, = *E. -der*, *-ther*, *-ter*, in under, other, after, etc. Cf. *under*.] A Latin preposition meaning 'between' or 'among,' used in some Latin phrases occurring in English books, as in *inter nos* (between or among ourselves), *inter arma silent leges* (laws are silent among arms—that is, in time of war), etc., and very common as a prefix. See *inter-*.

inter³, *v.* A Middle English form of *enter*¹. **inter-** [Early mod. E. also *enter-* (a form still extant in *entertain*, *enterprise*, etc.); ME. *entree*, *entre*, rarely *inter-*, < OF. *entre*, *inter-*, < F. *entre*, *inter-* = *Sp. Pg. entre*, *inter-* = *It. entre*, *inter-*, < L. *inter-* (changed to *intel-* before *l*, namely, in *intelligere*, *intelligere*, understand: see *intellect*, *intelligent*, etc.), a very common pre-

fix, being the adv. and prep. *inter* used with verbs and nouns, with the meaning 'between, among, amid, during,' in some instances 'under, down'; see *inter*². A common prefix meaning 'between' or 'among' or 'during,' occurring in many English words taken from the Latin, either directly or through Middle English and Old French or French forms (being then in Middle English also *enter*-, and so retained in some modern forms: see *enter*-), or formed in English on the Latin model. Words formed in English with this prefix may have the second element of non-Latin origin, as in *interdash*, *interknow*, *interangle*, *interweave*, etc. The second element is (in the original) either a verb, as in *interact*, *v.*, *intercalate*, *intercept*, *interchange*, etc., or a noun, as in *interact*, *n.*, *interaxis*, *interval*, *intervale*, etc. The prefix is freely used in English in the making of new compounds, often without immediate reference to its Latin status. In such cases, in the following etymologies, it is, for the sake of brevity, usually treated as an English prefix, and not carried back to the Latin preposition as in other cases. For the relation of *inter*- to the second element in adjectives, compare the similar relation of *ante*-, *anti*-, etc.

In *chron.*, inserted in the calendar out of regular order, as an extra day or month; having an additional day or month, as one of a cycle of years. The lunar reckoning and other features of the Greek, Roman, and other ancient calendars made the year of twelve months too short, and intercalary days and months were officially added at intervals to adjust the difference. Since the reformation of the calendar by Julius Caesar, in 46 B. C., only one intercalary day in every fourth year, or leap-year, has been required, the 29th of February.

Ve Adar was an *intercalary* month, added, some years, unto the other twelve, to make the solar and lunar year agree.

(b) In *med.*, the days intervening between the critical days or crises of a disease.—**Intercalary growth**, in *bot.*, a form of growth observed in certain fungi and algae, in which the new part is intercalated into the old. In *Edogonium*, for example, the cells frequently present a striated appearance at one extremity, the striation being the result of *intercalary growth*—that is, just below the septum of the cell a ring or cushion of cellulose is formed, and at this point the cell-wall splits, as if by a circular cut, into two pieces, which separate from each other, but remain attached to the ring or cushion. The process is repeated, the next ring forming a little further away from the septum.

The typical form of *intercalary growth* takes place in definite belts which surround the cell.

In *Rom. law*, an adjudication, by a solemn ordinance issued by the pretor, in his capacity of governing magistrate, for the purpose of quieting a controversy, usually as to peaceable possession, between private parties. More specifically—(a) in earlier times, a prohibition or injunction incidental or introductory to an action, forbidding interference with possession until the right should have been determined; (b) in later times, the extension of this remedy so as to include not merely such injunctive relief, but also production or discovery (called *exhibitory interdīt* or *nterdict for production*), and the delivery of possession, the reinstatement of a previous situation, or other undoing of a wrong (called *nterdict of restitution*). Throughout the various extensions of the term the characteristic idea seems to have been the act of the pretor in assuming in some sense the functions of a plaintiff or a prosecutor on grounds of public policy, somewhat as in modern practice the court makes orders or decrees upon some subjects, which, though made in a private controversy, it will enforce in the name of the people by proceedings for contempt.

6. In law, in the most general sense, legal concern of a person in a thing or in the conduct of another person, whether it consist in a right of enjoyment in or benefit from property, or a right of advantage, or a subjection to liability in the event of conduct; more specifically, a right in property, or to some of those uses or benefits from which the property is inseparable. In a narrower sense it was used in the English common law of real property, to designate a right less than an estate, such as a lease or an easement, etc.

7. Payment, or a sum paid, for the use of money, or for forbearance of a debt. The *interest* bears a fixed ratio (agreed upon by the parties) to the sum loaned, and is to be paid at certain stated times, as once or twice a year. The money lent or due is called the *principal*, the sum paid for the use of it the *interest*, the fixed ratio, which is so many units in one hundred, the *rate per cent.*, or simply the *per cent.* The rate per cent. is usually a much a year, or per annum. Sometimes the rate is mentioned as so much per month; \$100 at 1 per cent. per month is equal to \$100 at 12 per cent. per annum. *Legal interest* is the rate established by law, and it is always understood that legal interest is intended when no specific rate is mentioned. *Interest* greater than the legal rate is usury, and is prohibited by law. In certain jurisdictions, however, it is allowable to give and receive higher than legal rates by special contract between the parties. *Interest* may be either *simple* or *compound*. *Simple interest* is the interest arising from the principal sum only, and, though not paid, is not itself chargeable with *interest*. *Compound interest* is the interest paid not only on the original or principal sum, but also on the *interest* as it falls due and, remaining unpaid, is added to the principal.

Who pawn their souls and put them out at *interest* for a very small present advantage, although they are sure in a very little time to lose both their *Interest* and the Principal too.

When two similar and equal series of waves arrive at a common point, they *interfere*, as it is called, with one another, so that the actual disturbance of the medium at any instant is the resultant of the disturbances which it would have suffered at that instant from the two series separately. In *physics*, the mutual action of waves of any kind (whether those in water, or sound, heat, light-waves) upon one another, by which, under certain conditions, the vibrations and their effects are increased, diminished, or neutralized. The term was first employed by Dr. Young to express certain phenomena which result from the mutual action of the rays of light on one another. In general, if two systems of waves come together, they *interfere*—that is, they unite to reinforce one another, the actual disturbance of the medium at any instant being the resultant of the two disturbances considered separately.

For example, if the two systems are of equal intensity and the same phase, the result will be a doubled disturbance; if, however, they are half a wave-length apart, the result will be rest. Thus, two sounds of the same pitch and intensity produce a note of double the intensity when they are in the same phase, the point of condensation of one corresponding to that of the other; when, on the other hand, the point of maximum condensation of the first corresponds to that of rarefaction of the other, they destroy each other. Again, if two notes differing but slightly in pitch (say one vibration per second) are sounded together, there will be one instant in each second when the two wave-systems will nearly coincide in phase, and one when they will be half a wave-length apart; the result is that they alternately strengthen and weaken each other at equal moments, and the ear perceives the pulsations in the tone called *beats* (see *beat*, 7). The same principles hold true in the case of light, as was first shown by Young.

The interference of light-waves is illustrated by the phenomena of diffraction (see *diffraction*): thus, a diffraction grating gives with monochromatic light a series of light and dark bands (*interference fringes*), corresponding respectively to the points of maximum and minimum motion resulting from the mutual action of the two wave-systems; the former they are in the same phase, for the latter they differ in phase by half a wave-length. If white light is employed, a series of spectra (*interference spectra*) of different orders is obtained. Newton's rings, obtained, for example, when ordinary light is reflected from a convex lens of long focus pressed upon a plate of glass, are circular interference spectra. The colors of thin films, as of oil on water or of a soap-bubble, are due to interference, as is also the iridescence of some antique glass or of mother-of-pearl. Still again, the beautiful figures produced when a sec-

tion of an uniaxial crystal cut normal to the axis, or of a biaxial crystal cut normal to the bisectrix, is viewed in converging polarized light are similar phenomena, and are hence called *interference figures*. Recently (1888-9) Hertz

Interference Figures of a Biaxial Crystal: (1) when the axial plane (passing through the two axes) is inclined 45° to the vibration-planes of the polarizer and analyzer, and (2) when it is respectively parallel and perpendicular to them.

has shown that electric waves, produced, for example, by induction discharges between two metal surfaces and propagated through space, also exhibit under proper conditions interference phenomena. These waves may have a length of several feet. See *wave*.—**Syn.** 1. *Mediation*, *Intervention*, etc. See *interposition*.

international (in-tér-nash'ōn-āl), *a. and n.* [= *F. international* = *Sp. Pg. internacional* = *It. internazionale* (all after E.); as *inter- + national*.] I. *a.* 1. Pertaining to or mutually affecting two or more nations; concerning different nations in common: as, an *international* exhibition; *international law*; *international relations*.

With regard to the political quality of the persons whose conduct is the object of the law. These may, on any given occasion, be considered either as members of the same state, or as members of different states: in the first case, the law may be referred to the head of internal, in the second case, to that of *international* jurisprudence. . . . The word *international*, it must be acknowledged, is a new one; though, it is hoped, sufficiently analogous and intelligible. It is calculated to express, in a more significant way, the branch of law which goes commonly under the name of the law of nations: an appellation so uncharacteristic that, were it not for the force of custom, it would seem rather to refer to internal jurisprudence. The chancellor D'Aguesseau has already made, I find, a similar remark: he says that what is commonly called *droit des gens* ought rather to be termed *droit entre les gens*.

Bentham, Introd. to Principles of Morals, xvii. 25, note.

2. [*cap.*] Of or pertaining to the society called the International.

The essence of the *International* movement was a federal association, a combination of movements in part already begun, with the social end in view of raising the operatives up over against the employers and capitalists.

Woolsey, Communism and Socialism, p. 133.

International alphabet. See *Morse alphabet*, under *alphabet*.—**International copyright**. See *copyright*.—**International embargo**. See *embargo*. I.—**International law**, the law of nations; those maxims or rules which independent political societies or states observe, or ought to observe, in their conduct toward one another; the system of rules which regulates the intercourse and determines the rights and obligations of sovereign states (Minor). More specifically, *international law* is the aggregate of the rules which Christian states acknowledge as obligatory in their relations to each other's subjects. The rules also which they unite to impose on their subjects, respectively, for the treatment of one another, are included here, as being in the end rules of action for the states themselves.

The classical expression for *international law* is *Jus Feciale*, or the law of negotiation and diplomacy.

Maine, Ancient Law, p. 33.

International law, as we have viewed it, is a system of rules adopted by the free choice of certain nations for the

purpose of governing their intercourse with each other, and not inconsistent with the principles of natural justice.

Woolsey, *Introd. to Inter. Law*, § 203.

Private international law, the rules by which the laws of one state are recognized and applied, in the courts of another, civil or private rights of persons of, or property within, the former.

It is the province of *private international law* to decide which of two conflicting laws of different territories is to be applied in the decision of cases; and for this reason this branch is sometimes called the conflict of laws. It is called private, because it is concerned with the private rights and relations of individuals.

Woolsey, *Introd. to Inter. Law*, § 69.

II. n. [cap.] 1. A society (in full, "the International Workingmen's Association"), formed in London in 1864, designed to unite the working classes of all countries in promoting social and industrial reform by political means. Its chief aims were: (1) the subordination of capital to labor through the transference of industrial enterprises from the capitalists to bodies of workmen; (2) the encouragement of men on strike by gifts of money, or by preventing laborers of one locality from migrating to another when the laborers in the latter are on strike; (3) the overthrow of all laws, customs, and privileges considered hostile to the working classes, and the encouragement of whatever aids them, as the shortening of hours of labor, free public education, etc.; (4) the end of all wars. By 1867 the International had become a powerful organization, though strenuously opposed by the continental European governments; but its manifestation in 1872 of sympathy with the doings of the Paris Commune in the preceding year, and internal dissensions, caused a great loss of reputation and strength.

Of the *International Marx* was the inspiring and controlling head from the beginning; and the German social democracy, though originated by Lassalle, before long fell under Marx's influence. *Encyc. Brit.*, XXII. 214.

2. To alter, as a book or manuscript, by insertion of new matter; introduce new words or phrases into; especially, to corrupt or vitiate by spurious insertions or additions.

How strangely Ignatius is mangled and interpolated you may see by the vast difference of all copies and editions, Greek and Latin. *Bp. Barlow*, *Remains*, p. 115.

3. In *math.* and *physics*, to introduce, in a series of numbers or observations (one or more intermediate terms), in accordance with the law of the series; make the necessary interpolations in: as, to interpolate a number or a table of numbers.

The word *interpolate* has been adopted in analysis to denote primarily the interposing of missing terms in a series of quantities supposed subject to a determinate law of magnitude, but secondarily and more generally to denote the calculating, under some hypothesis of law or continuity, of any term of a series from the values of other terms supposed given. *Boole*, *Finite Differences* (2d ed.).

Bacon, *Political Fables*, v., Expl.

=*Syn.* 2. *Interpose*, *Interfere*, *Intermeddle*, *Intervene*. To *intermeddle* is both unwelcome and impertinent. To *interfere* is unwelcome to the one interfered with, and often but not necessarily improper: as, the court *interfered* to prevent further injustice. In this sentence *interposed* would have been a very proper word to express the benevolence and helpfulness of the action of the court, while *interfere* suggests the checking of what was going on and the balking of selfish plans. *Interpose* in its personal application is generally used in a good sense. *Interfere* may be used of a person or of a thing; *intermeddle* only of a person or the act of a person. *Intervene* is used only of things literally or figuratively coming between, and hence without either praise or blame: as, several weeks *intervened*; an *intervening* piece of woods. A piece of woods may *interfere* with a view; we must *interfere* in a quarrel when life is threatened. See *intrude*.

interposer (in-tér-pôz), *n.* [< *interpose*, *v.*] *Interpos*; interposition.

The word *mediation* is rarely used where the friendly *interposition* is not consented to by the parties to the controversy, or where it is not at least in some degree successful.

H. Spencer, Study of Sociol., p. 321.

2. The sense given by an interpreter; assumed meaning; apparent meaning; signification: as, varying interpretations of the same passage or event; to put a bad interpretation upon anything. In law, interpretation in this sense usually implies either (1) that a word or phrase, read in the light of other parts of the instrument or of extrinsic evidence, is found to have a meaning different from that first apparent on its face; or (2) that a word or passage not clear in itself is found, by transposition or reconstruction of the order of words or by different punctuation, to have a clear meaning; and hence the maxim that it is not allowable to interpret that which has no need of interpretation.

4. Specifically, in *entom.*, one of the spaces between longitudinal striae of the elytra. When the striae are regular, both they and the intervals are numbered from the suture outward. —5. In *music*, the difference or distance in pitch between two tones. If the tones are sounded simultaneously, the interval is *harmonic*; if successively, *melodic*. An interval is acoustically described by the ratio between the vibration-numbers of the two tones: thus, an octave is represented by the ratio 2:1; a fifth, by the ratio 3:2, etc. Musically the intervals between the key-note of a major scale and its several tones are regarded as the standards with which all possible intervals are compared and from which they are named. The standard intervals are as follows: do to do (C to C, F to F, etc.) is called a *first, prime, or unison*; do to re (C to D, F to G, etc.), a *second*; do to mi (C to E, F to A, etc.), a *third*; do to fa (C to F, F to B, etc.), a *fourth*; do to so (C to G, F to B, etc.), an *eighth or octave*, etc. These intervals are usually further designated thus: standard firsts, fourths, fifths, and octaves are *perfect*; standard seconds, thirds, sixths, sevenths, ninths, etc., are *major*. If an interval is a half-step longer than the corresponding standard interval, it is called *augmented* (or *sharp, superfluous, extreme, redundant*): thus, do to fa (C to F, F to B, etc.) is an *augmented fourth*; do to so (C to G, F to B, etc.) is an *augmented sixth*. If an interval is a half-step shorter than the corresponding major interval, it is called *minor* (or *flat*): thus, do to me (C to Eb, F to Ab, etc.) is a *minor third*, etc. If an interval is a half-step shorter than the corresponding perfect or minor interval, it is called *diminished*: thus, do to so (C to Gb, F to Cb, etc.) is a *diminished fifth* (also called *impure sixth*); do to le (Cb to Ab, Fb to Db, etc.) is a *diminished sixth*, etc. (This nomenclature is obviously inconsistent, and another is also in use, according to which all standard intervals are called *major*, all a half-step longer than the corresponding major intervals are called *augmented*, all a half-step shorter than the corresponding major are called *minor*, and all a half-step shorter than the corresponding minor are called *diminished*.) A given interval is measured and named by comparison with a major scale based on the lower tone of the interval. Intervals not greater than an octave are called *simple*; those greater than an octave, *compound*—*compound* intervals being reducible to simple ones by subtracting one or more octaves. When the upper tone of a simple interval is transposed an octave downward or its lower tone an octave upward, the interval is said to be *inverted*: inverted firsts become octaves, seconds become sevenths, thirds become sixths, etc.; and perfect intervals remain perfect, major intervals become minor, minor intervals become major, augmented intervals become diminished, and diminished intervals become augmented. Intervals are *consonant* or *dissonant*: the *perfect consonances* are standard firsts, fourths, fifths, and octaves; the *imperfect consonances* are major or minor thirds and sixths; and the *dissonances* are major or minor seconds and sevenths, with all augmented and diminished

intervals. The acoustical values of the more important recognized intervals are as follows:

	Pure.	Tempered.

The values given in the first column are those of the ideal intervals, such as are secured by using *pure* intonation; those given in the second column are those of *equally tempered* intonation, such as is used on keyed instruments, like the piano-forte and the organ. (See *intonation* and *temperament*.) A *diatonic* interval is one that occurs between two tones of a normal major or minor scale. A *chromatic* interval is one that occurs between a tone of such a scale and a tone foreign to that scale. An *enharmonic* interval is one on an instrument of fixed intonation, that is apparent only in the notation, being in fact a unison, as on the piano-forte, the interval from F $\sharp$ to G $\flat$. In musical science the theory of intervals is introductory to that of chords and to harmony in general.

The distinction is perfectly sound, and still endures, though *Carus*'s interpretation of the homologies of the parts is abandoned. The three intervertebrae are now regarded as the skeletons of the ear, eye, and nose: namely, the auditory or otic capsule or otocrane (the petrosal or petromastoid part of the temporal bone), the sclerotic coat of the eyeball (extensively ossified in many animals), and the ethmoid bone (mesethmoid and pair of ethmoturbinals).

II. *n.* In *anat.*, the lower part of the alimentary canal, extending from the pyloric end of the stomach to the anus; gut; bowel: in popular use usually in the plural: the guts; bowels; entrails. In a wider sense, in biology, the term is also used to include the whole alimentary canal or enteron. (See *alimentary* and *enteron*.) In man, as in other vertebrates and many invertebrates, the intestine is the tube into which partly digested food is received from the stomach, for the completion of the digestive process by the action upon the food of certain secretions (as the hepatic, pancreatic, and intestinal), the drawing off of the assimilable material by the blood-vessels and lacteals, and the ejection of the refuse or non-assimilable substances, as feces or excrement, by the anus. The length of the human intestine is five or six times that of the body, such extent representing, perhaps, an average of relative length; the intestine is generally shorter in carnivorous animals, and longer in those which are herbivorous. It is a musculo-membranous tube invested with a peritoneal coat, lined with mucous membrane, and having in its walls both longitudinal and circular muscular fibers. It lies coiled in many convolutions in the abdomen, the coils being freely movable, though the tube as a whole is held in place by mesenteric folds of peritoneum. Into it are poured the secretions of the liver and pancreas, as well as those of its own numerous glandular structures. The character of the tube in man and mammals generally has caused its division into a small and a large intestine. The former extends from the pylorus to the iliocecal valve, and

Human Stomach and Intestines.

a., vermiform appendage; *ac*, ascending colon; *ce*, caecum; *ce*, cardiac end of stomach; *ac*, duodenum; *dc*, descending colon; *si*, rectum, ending at anus; *il*, large intestine or colon, including *ac*, *ce*, *dc*; *je*, termination of esophagus; *py*, pyloric end of stomach, whence the coiled small intestine (duodenum, jejunum, and ileum) extends to *il*; *ce*, transverse colon.

It is subdivided into duodenum, jejunum, and ileum. The latter consists of the caecum or head of the colon, with its appendix vermiformis; of the colon proper, divided into ascending, transverse, and descending; and of the rectum or straight gut, continued from the descending colon by the sigmoid flexure. The small intestine is smoothly and simply tubular; the large is more or less extensively sacculated. This distinction does not hold as a rule below

mammals, in many of which, also, the cecum is of comparatively enormous extent. Thus, in birds, in which there are commonly a pair of caeca, the site of these organs marks the only distinction between the preceding and succeeding portions of the tube. In many lower vertebrates, as fishes, caeca may be very numerous, and situated near the pylorus. In all vertebrates the cavity of the intestine is primitively continuous with that of the umbilical vesicle, and in those which have an allantois with the cavity of that organ. In its simplest possible form the intestine represents the interior of a gastrula. See cut under *gastrula*.

The intestines appear to be affected with albuminoid disease next in frequency to the spleen, liver, kidneys, and lymphatic glands. *Quain, Med. Dict., p. 750.*

Clavate intestine. See *clavate*.—**Thick intestine**, in certain insects, a distention of the posterior end of the ileum, forming a large blind sac which is turned back toward the ventriculus. It is thickened, and ridged on the inner surface. Its function appears to be to subject the food to a second digestion before it is passed out of the body.

But the distinction of transitive and intransitive is not a very sharp one in English. Every transitive verb is capable of being used also intransitively, or without an expressed object; and, on the other hand, many intransitives may be used transitively (the verb being usually causal), taking a direct object, as in to run a horse, or merely a cognate object, as in to run a race; or are used factitively with a more general object, as in to breathe a prayer, to look love, or with an objective predicate, as in to sing one's self horse, to stare one out of countenance, and so on. Owing, also, to the non-distinction of dative and accusative in modern English, a construction often seems transitive which is historically intransitive: as, to forgive us, where *us* is historically dative, the direct object being understood, or expressed as in "forgive us our debts." It. introito*, < *L. introitus*, a going in, entrance, < *introire*, go in, enter, < *intro*, within, + *ire*, go: see *iter*.] In *liturgies*, an antiphon sung by the priest and choir as the priest approaches the altar to celebrate the mass or communion. The name *introit* (*introitus*, literally "entrance") is an abridgment of *antiphon* at the *introit* (*antiphona ad introitum*), and has been explained as referring to the entrance of the people into church rather than that of the priest into the sanctuary. The *introit* seems to have originated in the psalms sung at the beginning of the Jewish liturgy. The name *antiphon* has been given by preeminence to the *introit*, as in the Greek Church, where it is threefold, answering to the Western *introito*, *introit*, and *Gloria in Excelsis*. The Greek antiphons consist of verses from the Psalms with a constant response, or of the psalms called *Typica* and the *Beattitudes*. In the liturgies of St. Mark and St. James the hymn, "Only-begotten Son" is the *introit*, in the Armenian liturgy this is followed by a psalm and hymn. The "Only-begotten Son" is also subjoined to the Greek second antiphon. The Roman *introit* (see *invitatory*) consists of a verse (the *introit* in the narrower sense), followed by a verse of a psalm, the *Gloria Patri*, and the repetition of the first verse. In the Ambrosian rite the *introit* is called the *ingressa*. An

ancient Gallican name for it was the *prælepis*. In the Mozarabic liturgy, in certain monastic rites, and in Norman and English missals, it is called the *officium* or *office*. Psalms as special *introits* are appointed in the Prayer-book of 1549 and in the Nonjuror's communion office of 1718. In the Anglican Church at the present day a psalm or anthem is sung as the *introit*. The name is sometimes less properly used for a hymn or any musical composition sung or played at the beginning of the communion office.

Max Müller, Sci. of Lang., 1st ser., p. 29.

3. Specifically, in *philos.*, an immediate cognition of an object as existent.

The term *intuition* is not unambiguous. Besides its original and proper meaning (as a visual perception), it has been employed to denote a kind of apprehension, and a kind of judgment. Under the former head, *intuition* or intuitive knowledge has been used in the six following significations:—a.—To denote a perception of the actual and abstract in opposition to the abstractive knowledge which we have of the possible in imagination and of the past in memory. b.—To denote an immediate apprehension of a thing in itself, in contrast to a representative, vicarious, or mediate apprehension of it, in or through something else. (Hence, by Fichte, Schelling, and others, *Intuition* is employed to designate the cognition as opposed to the conception of the Absolute.) c.—To denote the knowledge which we can adequately represent in imagination, in contradistinction to the symbolical knowledge which we cannot image, but only think or conceive, through and under a sign or word. (Hence, probably, Kant's application of the term to the forms of the sensibility—the imaginations of space and time—in contrast to the forms or categories of the understanding.) d.—To denote perception proper (the objective), in contrast to sensation proper (the subjective), in our sensitive consciousness. e.—To denote the simple apprehension of a notion, in contradistinction to the complex apprehension of the terms of a proposition. Under the latter head it has only a single signification, viz.: f.—To denote the immediate affirmation by the intellect, that the predicate does or does not pertain to the subject, in what are called self-evident propositions. All these meanings, however, with the exception of the fourth, have this in common, that they express the condition of an immediate in opposition to mediate knowledge.

Sir W. Hamilton, Reid's Works, p. 759, note A, § 5.

The term *intuition* will be taken as signifying a cognition not determined by a previous cognition of the same object, and therefore so determined by something out of the consciousness. The word *intuitus* first occurs as a technical term in St. Anselm's Monologium. He wished to distinguish between our knowledge of God and our knowledge of finite things (and in the next word of God also); and, thinking of the saying of St. Paul, "Videmus nunc per speculum in ænigmatæ: tunc autem facie ad faciem," he called the former speculation and the latter *intuition*. This use of "speculation" did not take root, because that word already had another exact and widely different signification. In the middle ages the term "intuitive cognition" had two principal senses: 1st, as opposed to abstractive cognition, it meant the knowledge of the present as present, and this is its meaning in Anselm; but, 2d, as no intuitive cognition was allowed to be determined by a previous cognition, it came to be used as the opposite of discursive cognition (see *Scotus*), and this is nearly the sense in which I employ it. *C. S. Peirce.*

[Some writers hold that the German *Anschauung* should not be translated by *intuition*. But this term is a part of the Kantian terminology, the whole of which was framed in Latin and translated into German, and this word in particular was used by Kant in his Latin writings in the form *intuitus*, and he frequently brackets this form after *Anschauung*, to make his meaning clear. Besides, the *cognitio intuitiva* of Scotus, who anticipated some of Kant's most important views on this subject, is almost identical with Kant's own definition of *Anschauung*. *Intellectual intuition*, used since Kant for an immediate cognition of the existence of God, was by the German mystics employed for their spiritual illumination (the term *intuitio intellectualis* was borrowed by them from Cardinal de Cusa), or light of nature.]

We are indebted to *invention* for the thermometer, barometer, telephone, etc.; to *discovery* for knowledge of hitherto unknown parts of the globe, etc. By the *invention* of the spectroscope we have made large *discoveries* as to the metallic elements in many heavenly bodies. See *discover*.—*6.* *Invention*, *Style*, *Amplification*. Rhetoric is often divided into the departments of *invention* and *style*, *invention* covering all that concerns the supply of the thought, and *style* all that concerns the expression of the thought in language. Some writers divide rhetoric into *invention*, *amplification*, and *style*, but amplification is strictly a part of *invention*.

2. In *math.*, opposite in nature and effect: said with reference to any two operations which, when both performed in succession upon the same quantity, leave it unaltered: thus, subtraction is *inverse* to addition, division to multiplication, extraction of roots to the raising of powers, etc. A direct operation produces an unambiguous and possible value, and between two operations the one which combines quantities symmetrically is preferably considered as direct. Addition, multiplication, involution, and differentiation are considered as direct operations; subtraction, division, evolution, and integration as *inverse* operations. Corresponding to every direct operation there are, generally speaking, two *inverse* operations: thus, if $F(x, y)$ be the direct operation, the two *inverse* operations are the one which gives x from $F(x, y)$ and y , and the one which gives y from $F(x, y)$ and x .—**Inverse congruity, current, difference**, etc. See the nouns.—**Inverse curve, line, point**, etc., a curve, line, point, etc., resulting from spherical, quadric, and other varieties of geometrical inversion.—**Inverse ellipsoid of inertia**. The several inversions of a chord are called first, second, and third respectively. See *interval*, 5, and *chord*, 4. (2) The process, act, or result of repeating a subject or theme with

all its upward intervals or steps taken downward, and vice versa. Also called *imitation by inversion* or *in contrary motion*. (See *imitation*, 3.) **Retrograde inversion**, however, is the same as *retrograde imitation* (which see, under *imitation*, 3). (3) In *double counterpoint*, the transposition of the upper voice-part below the lower, and vice versa. Inversion is the test of the correctness of the composition. The transposition may be either *in contravert* or of any other interval. See *invert-sugar*.—**Circle of inversion**, a succession with respect to which a given curve is its own *inverse*.—**Geometrical inversion** (usually taken to mean *cyclical* or *spherical inversion*), a transformation by which for each point of a figure is substituted a point in the same direction from a fixed point, called the *center of inversion*, and at a distance therefrom equal to the reciprocal of the distance of the first point.—**Inversion of an organ- or pedal-point**. See *organ-point*.—**Inversion of parts**. See *def. (c) (3)*.—**Inversion of subjects**. See *def. (c) (2)*.—**Quadric inversion**, in *math.*, a transformation of a figure consisting in substituting for each point one lying in the same direction from a fixed center, and on the polar of the variable point with reference to a quadric surface.—**Tangential inversion**, in *math.*, a transformation by which for every straight line of a figure is substituted a parallel line passing through the pole of the first with reference to a conic.

It includes seven of the eight main branches into which *Animalia* are divisible, namely *Protozoa*, *Celesterrata*, *Echinodermata*, *Vermes*, *Arthropoda*, *Mollusca*, and *Malacostraca*, thus leaving only the *Vertebrata* as the remaining subkingdom, of equal rank only with any one of the others, not with them all collectively. The word, however, no longer retains any exact taxonomic

significance, being simply used to designate those animals collectively which are not vertebrated. The primary division of the animal kingdom now made is into *Protozoa* and *Metazoa*, and the *Vertebrata* form one of the divisions of the latter, to be contrasted with any one of the prime divisions of the metazoic *Invertebrata*, not with the *Invertebrata* collectively. Both terms (*Vertebrata* and *Invertebrata*) originated with Lamarck, about the beginning of the nineteenth century. Also called *Evertebrata*.

(*c*) In *geol.*, lying apparently in inverse or reverse order, as strata which have been folded back on each other by the intrusion of igneous rocks or by crust movements.

— **Inverted arch**, in *arch*, an arch with its intrados below the axis or springing line. Inverted arches are used in foundations to connect particular points, and distribute their weight or pressure over a greater extent of surface, as in piers and the like.

— **Inverted chord**. See *inversion* (*c*)

(1), and *chord*, 4. — **Inverted comma**, in *printing*, a comma turned upside down so as to bring it into a superior position. The beginning of a quotation is marked by a pair of inverted commas or by one alone, as the end is by a pair of apostrophes or by a single apostrophe. (See *quotation*.) A pair of inverted commas is also often used to signify *dito*, being placed directly under the word to be repeated. — **Inverted counterpoint**. See *inversion* (*c*) (3), *imitation*, 3, and *counterpoint*, 3. — **Inverted flower**, the name of several little South African plants of the former genus *Parasanthus*, which is now regarded as a section of the genus *Lobelia*. It is regarded as a mixture of equal parts of dextrose and levulose. A solution of cane-sugar turns the polarized ray of light to the right, while invert-sugar turns it to the left. From this inversion of the action on polarized light the process is called *inversion*, and the product *invert-sugar*.

Ch.*, the ceremony of conferring possession of the temporalities and privileges of his office upon a bishop or an abbot, by delivering to him the pastoral staff and ring, the symbols of his office. To whom the right of investiture belonged was long a point of conflict between the papacy and the monarchs of Europe. About the tenth century the monarchs controlled the bestowal of these symbols, but Hildebrand (Gregory VII.) in 1075 published a decree forbidding clergymen to receive investiture from a layman under pain

of deposition. This dispute between church and state was settled by the concordat of Worms, in 1122, by which the emperor Henry V. agreed to surrender the right of investiture on condition that the election to the office be held before him or his representative. A similar compromise had been made in 1107 between Henry I. of England and Pope Pascal II. The kings of France continued the contest, and at length secured the right of conferring separate investiture by means of a written instrument. At present, in Roman Catholic countries where the church is supported by the state, special agreements, or concordats, govern investiture: in nearly all these countries the consent of both the Pope and the civil authorities is necessary before investiture.—**Feudal investiture**, the public delivery of the land by the lord to the tenant, which under the feudal system created the estate in fee in the tenant, and the obligation of military or other feudal service in return. Beau. and Fl., Knight of Burning Pestle, v. 1.

Invisible church, the church in heaven and in the intermediate state: the church triumphant and the church expectant, as distinguished from the church militant.

Of the Church of God there be two parts, one triumphant and one militant, one *invisible* and the other visible. In the *invisible Church* are all they who, having finished their course in faith, do now rest from their labours.
Bp. Forbes, Explanation of the Nicene Creed (ed. 1888), p. 269.

Abp. Sharp, Works, i. xv.

How temptingly the landscape shines! the air
Breathes *invitation*. *Wordsworth, Excursion*, ix.

4. In the Anglican communion office, the brief exhortation beginning "Ye that (or who) do truly and earnestly repent you," and introducing the confession. It is first found in the "Order of the Communion" (1548), and in the Prayer-book of 1549, and has been continued, with gradual modifications, in the various revisions of the Prayer-book. Also called, less properly, the *invitory*.

invitatorium (in-vi-tâ-tô'ri-um), *n.*; pl. *invitatoria* (-â). [ML., neut. of LL. *invitatorius*, *invitatory*: see *invitory*.] Same as *invitory*, *n.* **invitory** (in-vi'tâ-tô-ri), *a.* and *n.* [= F. *invitatoire* = Sp. Pg. In the breviary offices it is immediately followed by a hymn. Its antiphon is called the *invitory*.

II. *n.*; pl. *invitories* (-riz). A form of invitation used in religious worship; something consisting of or containing invitation in church service.

The *invitory*. "Let us pray for the whole state of Christ's Church," was new.

R. W. Dixon, Hist. Church of Eng., xv. Specifically—(a) A form of exhortation to praise; especially, in the daily office of the Western Church, the variable antiphon to the Venite at matins. In the Anglican matins or morning prayer the versicle "Praise ye the Lord" (founded on the former "Alleluia" or "Laus tibi"), with its response, "The Lord's name be praised," serves as unvarying *invitory*. In the Greek Church the invariable *invitory* is the triple "O come, let us worship . . ." (Δεῦτε, προσκυνήσωμεν . . .) before the psalms at each of the canonical hours.

Then was sung that quickening call of the royal prophet "Venite, exultemus Domino—Come, let us praise the Lord with joy, &c." known in those times as now by the name of the *invitory*.

2. In *law*, a judicial call, demand, or order; as, the *invocation* of papers or evidence into a court.

—3. *Eccles.* (a) An invoking of the blessing of God upon any undertaking; especially, an opening prayer in a public service invoking divine blessing upon it; specifically, the words "In nomine Patris, et Filii, et Spiritus Sancti. Amen," "In the name of the Father, and of the Son, and of the Holy Ghost. Amen," used at the beginning of the Roman mass, before sermons in many Anglican churches, and on other occasions. (b) The third part of the prayer of consecration in the communion office of the American Book of Common Prayer, in the Scottish office of 1764 (from which that prayer is derived), and in the Nonjurors' office of 1718, on which, as well as on earlier Scottish and English offices and ancient Oriental liturgies, the Scottish office of 1764 is based. It follows the institution and the oblation, and invokes God the Father to send down the Holy Spirit on the eucharistic elements and on the communicants. A similar form of invocation (*epiclesis*), on which this is modeled, is found in the same sequence in almost all the more important primitive liturgies, and some authorities claim that it was originally universal. It is wanting, however, in the Roman Missal and in the present English Book of Common Prayer. In the first Prayer-book (1549) the invocation preceded the institution. (c) In the Roman Catholic and Anglican litanies, one of the petitions addressed to God in each person and in Trinity, and to the saints. The *invocations* are the first of the four main divisions of petitions in these litanies, the others being *deprecations* (with *obsecrations*), *intercessions*, and *supplications*.

The response to the *invocations* addressed to God is "Misereere nobis." "Have mercy upon us," to which the Anglican Prayer-book adds "miserable sinners."

The response to the *invocations* addressed to saints is "Orate pro nobis" ("Pray for us"). The *invocations* to saints are omitted in the Anglican litany.—*Invocation of saints*, in the Roman Catholic, the Greek, and other Christian churches, the act or practice of mentioning in prayer, asking the prayers of, or addressing prayers to angels or departed saints, in order to obtain their intercession with God.

invoice (in'vois), *n.* [Prob. < *F. envois*, pl. of *envoi*, *OF. envoi*, a sending, conveyance (lettre d'*envoi*, an invoice); see *envoy*.] In *com.*, a written account of the particulars of merchandise shipped or sent to a purchaser, consignee, factor, etc., with the value or prices and charges annexed. The word does not carry a necessary implication of ownership. In United States revenue law, an invoice sent from abroad is required to be made in triplicate and signed and dated by the seller of the merchandise described therein, and subsequently verified by the American consul or commercial agent of the United States in the port or country of shipment. The three invoices are classified as the *original*, or importer's, the *duplicate*, which is retained by the consul who collected it, and the *triplicate*, which is forwarded to the collector of the port to which the merchandise is consigned.

In some species of *Cornus*, many *Labiatae*, and other plants, the involucre is white or variously colored, constituting the showy part of the flower. (See cut.)

The same name is given also to the superincumbent covering or indusium of the sori of ferns. (See *indusium*, 2.) In some species of *Equisetum* the involucre is the annular or annular girdle situated between the uppermost whorl of leaf-sheaths and the whorl of sporangiferous scales. (Bennett and Murray, *Crypt. Bot.*, p. 110.)

In the *Hepaticae* it is the sheath immediately surrounding the female sexual organs, originating as an outgrowth of the plant-body. In marine algae it consists of the ramuli subtending a conceptacle, forming a more or less perfect whorl around it. (Harvey, *Brit. Marine Algae*, Glossary.)

2. Not voluntary or willed; independent of volition or consenting action of the mind; without the agency of the will: as, *involuntary* muscular action; an *involuntary* groan.

This at least I think evident, that we find in ourselves a power to begin or forbear, continue or end several actions of our minds, and motions of our bodies, barely by a thought or preference of the mind ordering, or, as it were, commanding the doing or not doing such or such a particular action. . . . The forbearance of that action, consequent to such order or command of the mind, is called *voluntary*; and whatsoever action is performed without such a thought of the mind is called *involuntary*.

2. Involved; confusedly mingled. [Rare.] The style is so *involute* that one cannot help fancying it must be falsely constructed. *Poe*, *Marginalia*, cxvii.

II. *n.* 1. That which is involved. [Rare.] Far more of our deepest thoughts and feelings pass to us through perplexed combinations of concrete objects, pass to us as *involved* (if I may coin that word) in compound experiences incapable of being disentangled, than ever reach us directly, and in their own abstract shapes. *De Quincey*, *Autobiog. Sketches*, i.

2. In *geom.*, the curve traced by any point of a flexible and inextensible string when the latter is unwrapped, under tension, from a given curve; or, in other words, the locus of a point in a right line which rolls, without sliding, over a given curve. The curve by unwrapping which a series of involutes is obtained is said to be their common evolute, and any two involutes of a curve constitute a pair of parallel curves, their corresponding tangents being parallel, and their corresponding points, situated on the same normal, being at a constant distance from one another.

Involute of a Circle.

involved (in-vō-lū-ted), *a.* Same as *involute*. **involution** (in-vō-lū'shon), *n.* [= *F. involution* = *Pr. envoluçio* = *It. involuzione*, < *LL. involutio(n)*, a rolling up, < *L. involvere*, pp. *involutus*, roll up: see *involve*.] 1. 4. A membranous covering or envelop; an involucre.

Sir T. Browne, *Vulg. Err.*, v. 23.

5. In *gram.*, complicated construction; the lengthening out of a sentence by the insertion of member within member; the separation of the subject from its predicate by the interjection of matter that should follow the verb or be placed in another sentence.

The long *involutions* of Latin periods. *Lowell*.

6. In *math.*: (a) The multiplication of a quantity into itself any number of times, so as to produce a positive integral power of that quantity. Thus, the operation by which the third power of 5 is found, namely, the multiplication of 5 by itself, making 25, and of the product by 5 again, making 125, is *involution*. In this sense *involution* is opposed to *evolution*, 3 (b). (b) The raising of a quantity to any power, positive, negative, fractional, or imaginary. In this sense *involution* includes *evolution* as a particular case. (c) A unidimensional continuous series of elements (such as the points of a line), considered as having a definite one-to-one correspondence with themselves, such that infinitely neighboring elements correspond to infinitely neighboring elements, and such that if A corresponds to B, then B corresponds to A: in other words, the elements are associated in conjugate pairs, so that any pair of conjugate elements may by a continuous motion come into coincidence with any other without ceasing, at any stage of the motion, to be conjugate. This is the usual meaning of *involution* in geometry; it dates from Desargues (1639). There are either two real sibi-conjugate or self-corresponding elements in an *involution*, when it is called a *hyperbolic involution*; or there are none, when it is called an *elliptic involution*. If $U = 0$, $V = 0$, $W = 0$ are three quadratic equations determining three pairs of points in an *involution*, then these three equations are in a syzygy $\lambda U + \mu V + \nu W = 0$; or if the three equations are $ax^2 + bxy + cy^2 = 0$, $a'x^2 + b'xy + c'y^2 = 0$, $a''x^2 + b''xy + c''y^2 = 0$, then the syzygy may be thus written:

$$\begin{vmatrix} a & b & c \\ a' & b' & c' \\ a'' & b'' & c'' \end{vmatrix} = 0.$$

The six elements are said to be an *involution* of six, or, if one or two of them are sibi-conjugate, an *involution* of five or of four elements. If the points of a line in a plane are in *involution*, let any conic (or degenerate conic) be drawn through any pair of conjugate points, and another conic through any other pair; then any conic through the four intersections of these conics will cut the line in a pair of conjugate points. That point of an *involution* which corresponds to the point at infinity is termed the *center* of the *involution*. They are all of very sparing solubility, excepting the iodates of the alkalis. See *iodic*.

Iodic acid is a white semitransparent solid substance, which is inodorous, but has an astringent, sour taste. It is very soluble in water, and detonates when heated with charcoal, sugar, and sulphur. Deoxidizing agents reduce it partly to hydriodic acid, which then reacts upon the remaining iodic acid to form iodine and water. It combines with metallic oxides, forming salts, which are named *iodates*, and these, like the chlorates, yield oxygen when heated, and an iodide remains.

iodine (i'ō-din or -din), *n.* [= F. *iodine*, < Gr. *iōnēs*, like a violet (< *iov*, a violet, = *L. viola*, v. ult. E. *violet*), + *-inēz²*.] Chemical symbol, I; atomic weight, 126.85. In chem., a peculiar non-metallic elementary solid substance, forming one of the group of halogens. It exists in the water of the ocean and mineral springs, in marine mollusks, in seaweeds, and in the nitrate deposits of western South America. At ordinary temperatures it is a solid crystalline body. Its color is bluish-black or grayish-black, with a metallic luster. It is often in scales, resembling those of micaceous iron ore; sometimes in brilliant rhomboidal plates or in elongated octahedrons. The specific gravity of solid iodine is 4.947. It fuses at 225° F., and boils at 347°. Its vapor, which is very dense, is of an exceedingly rich violet color, a character to which it owes the name of *iodine*. It is a non-conductor of electricity, and, like oxygen and chlorine,

is electronegative. It is very sparingly soluble in water, but dissolves copiously in alcohol and in ether, forming dark-brown liquids. It possesses strong powers of combination, and forms with the pure metals and most of the simple non-metallic substances compounds which are named *iodides*. With hydrogen and oxygen it forms iodic acid; combined with hydrogen it forms hydriodic acid. Like chlorine, it destroys vegetable colors, but with less energy. Iodine has a very acrid taste, and its odor somewhat resembles that of chlorine. It is an irritant poison, and is of great service in medicine. It is used externally as a counter-irritant, the skin or mucous membrane being painted with the tincture; and also internally, both as iodine and in combination, especially as iodide of potash. Starch is a characteristic test of iodine, forming with it a deep-blue compound. This test is so delicate that a solution of starch dropped into water containing less than a millionth part of iodine is tinged blue.—**Iodine green**. See *green¹*.—**Iodine scarlet**. Same as *pure scarlet* (which see, under *scarlet*).

iodize (i'ō-dīz), *v. t.*; pret. and pp. *iodized*, ppr. *iodizing*. [*< iod(ine) + -ize.*] 1. In med., to treat with iodine; affect with iodine.—2. In *photog.*, to impregnate, as collodion, with iodine; add iodine or an iodide to.

iodizer (i'ō-dī-zēr), *n.* [*< iodize + -er¹.*] One who or that which iodizes.

iodobromite (i'ō-dō-brō'mīt'), *n.* [*< iod(ine) + brom(ide) + -ite².*] A sulphur-yellow mineral, occurring in isometric crystals at Dornbach, Nassau, consisting of the iodide, bromide, and chlorid of lead.

iodoform (i'ō-dō-fōrm'), *n.* [*< iod(ine) + (chloro)form.*] A solid compound (CHI₃) analogous to chloroform, produced by the action of iodine with alkalis or alkali carbonates on alcohol. It forms lemon-yellow crystals, with an odor like that of saffron, which are somewhat volatile at the ordinary temperature, insoluble in water, but readily soluble in alcohol and ether. It is an anesthetic and antiseptic, and is used in surgical dressings.

iodoform (i'ō-dō-fōrm'), *v. t.* [*< iodoform, n.*] To apply iodoform to; impregnate with iodoform.

iodoformize (i'ō-dō-fōr'mīz), *v. t.*; pret. and pp. *iodoformized*, ppr. *iodoformizing*. [*< iodoform + -ize.*] To iodoform.

iodohydric (i'ō-dō-hī'drīk'), *a.* [*< iod(ine) + hydr(o)gen + -ic.*] Same as *hydioidic*.

iodol (i'ō-dol), *n.* [*< iod(ine) + -ol.*] A yellowish-brown substance (C₄I₄NH) composed of long prismatic crystals, used in medicine as an antiseptic.

iodometric (i'ō-dō-met'rīk'), *a.* [*< iod(ine) + metric.*] In chem., measured by iodine: used of analytical operations in which the quantity of a substance is determined by its reaction with a standard solution of iodine.

iodyrite (i'ō-dī-rīt'), *n.* [*< iod(ine) + Gr. ἰωδός, silver, + -ite² (cf. argyrite).*] Native silver iodide, a scintillating mineral of a bright-yellow color and resinous or adamantine luster, occurring sparingly in Chili and elsewhere.

iolite (i'ō-līt'), *n.* [*Gr. iōv, a violet, + ἰλιός, stone.*] A silicate of magnesium, aluminium, and iron, a mineral of a violet-blue color with a shade of purple or black. It often occurs in six-sided rhombic prisms. The smoky-blue pelion and steinheilite are varieties. Iolite is very subject to chemical alteration, and many names have been given to the more or less distinct compounds so formed, as *pinite*, *fahsinite*, *giantolite*, etc. Also called *dichroite* (because the tints along the two axes are unlike) and *cordierite*.

ion (i'ōn), *n.* [*Gr. ἰών, neut. ἰών, ppr. of ἵσται, L. ire, go: see iter.*] One of the elements of an electrolyte, or compound body undergoing electrolyzation. Those elements of an electrolyte which are evolved at the anode are termed *anions*, and those which are evolved at the cathode *cations*, and when these are spoken of together they are called *ions*. The water when electrolyzed evolves the ions, oxygen and hydrogen, the former being an anion, the latter a cation.

-ion. [ME. *-ion*, *-ioun*, *-iun* (-on, -un), < OF. *-ion*, *-iun* (-on, -un), *F. -ion* (-on) = Pr. *-ion*, *-io* = Sp. *-ion* = Pg. *-ão* = It. *-ione*, < L. *-io(n)-*, a common suffix forming (a) abstract (fem.) nouns from verbs, either from the inf., as *legio(n)-*, a legion, < *legere*, collect, *optio(n)-*, a choice, < *optare*, choose, *suspicio(n)-*, suspicion, < *suspiciere*, suspect, etc., or from adjectives, as *communio(n)-*, communion, < *communis*, common, *unio(n)-*, union, < *unus*, one, etc.; or (b) appellative (masc.) nouns, of various origin, as *centurio(n)-*, a centurion, *histrion(n)-*, an actor, etc. See *-tion*, *-ation*, etc.] 1. A suffix in abstract nouns (many also used as concrete) of Latin origin, as in *legion*, *opinion*, *option*, *region*, *religion*, *suspicion*, *communio*, *union*, etc.—2. A similar suffix occurring in a few concrete nouns designating per-

sons or things, as in *centurion*, *histrion*, *unio* (a pearl), *onion*, *pavilion*, etc.

Ionian (i'ō-ni-an), *a.* and *n.* [*L. Ionius*, < Gr. Ἰωνίος, < Ἰωνία, Ionia, Ἴωνες, the Ionians.] 1. *a.* Relating to Ionia or to the Ionians; Ionic.—**Ionian chiton**, mode, etc. See the nouns.—**Ionian school**. Same as *Ionic school* (which see, under *Ionic*).—**Ionian sea**, that part of the Mediterranean which lies between Greece and Sicily.

II. *n.* A member of one of the three or (as some count) four great divisions of the ancient Greek race, the others being the Dorians and *Æolians*, or the Dorians, *Æolians*, and *Acheans*. Originally they inhabited Attica, Euboea, and the district in the Peloponnesus afterward known as Achæa. From Attica they spread over most of the islands (the Ionian Islands) of the *Ægean* sea, and settled in Ionia on the coast of Asia Minor. They founded various colonies on the shores of the Euxine, Propontis, and the *Ægean*, and in the west they planted Catania and other colonies in Sicily; Rhegium, Cumæ, etc., in Italy; and Marseilles and others in Gaul. The Asiatic Ionians especially did much to introduce Asiatic civilization and luxury into Greece, and were often reproached by the other Greeks with effeminacy. Also (rarely) called *Iastian*, and in the plural *Ionies*.

Ionic (i'ō-n'ik'), *a.* and *n.* [*L. Ionicus*, < Gr. Ἰωνικός, < Ἰωνία, Ionia; see *Ionian*.] 1. *a.* Of, pertaining, or relating to the Ionians or Ionians as a race, or to one of the regions named from them, Ionia or the Ionian Islands: as, the *Ionic dialect* or school; the *Ionic order*.—2. In *anc. pros.*, constituting a foot of two long syllables followed by two shorts, or vice versa; pertaining to or consisting of such feet: as, an *Ionic foot*, colon, verse, or system; *Ionic rhythm*.—**Axis of the Ionic capital**. See *axis¹*.—**Ionic dialect**, the most important of the three main branches of the ancient Greek language (the other two being the Doric and *Æolic*), including the Attic. Homer's *Iliad* was written in Old Ionic, the works of Herodotus in New Ionic, and nearly all the great Greek works in its later form, the Attic.—**Ionic foot, in *pros.*, a foot consisting of four syllables, either two short and two long or two long and two short.—**Ionic meter**, a meter consisting of Ionic feet.—**Ionic mode**. See *mode*.—**Ionic order**, in *arch.*, one of the three Greek orders, so named from the Ionic race, by whom it was held to have been developed and perfected. The distinguishing characteristic of this order is the volute of its capital. In the true Ionic the volutes have the same form on the front and rear, and are connected on the flanks by an ornamented roll or scroll, except in the case of the corner capitals, which have three volutes on their three outer faces, that on the external angle projecting diagonally. The debased Roman form of Ionic gave the capital four diagonal volutes, and curved the sides of the abacus. The spiral fillets of the Greek volute are continued along the face of the capital, beneath the abacus, whereas in the Roman**

imitation the origin of the fillet is behind the echinus. The shaft, including the base and the capital to the bottom of the volute, is normally about 9 diameters high, and is generally fluted in 24 flutes, separated by fillets. The bases used with this order are various. The Attic base often occurs, and is the most beautiful and appropriate. The architrave is normally formed in three bands, each projecting slightly beyond that below it, the whole crowned by a rich molding. The frieze frequently bears figures in relief. The cornices fall under three classes: the simple but richly molded and strongly projecting Greek cornice, and the less refined dentil and modillion (Roman) cornices. The best examples of the Ionic order are the temple on the Ilissus, and the Erechtheum, and the temple of Wingless Victory on the Acropolis of Athens. The details of the Erechtheum are notable for the delicate elaboration of their ornament: but the interior capitals of the Propylæa are, in their simple purity of line, perhaps the noblest remains of the Greek Ionic. The order was probably evolved by the Ionian Greeks from forms found in Assyrian architecture. There are three varieties, the brown, red, and gray, all products of the same plant, and their differences are due to little more than age, place of growth, or mode of drying. The root is hard, and breaks short and granular (not fibrous), exhibiting a resinous, waxy, or farinaceous interior, white or grayish. It is emetic, purgative, and diaphoretic, and is much used in medicine, in large doses (1.5 grams) as an emetic, in smaller doses as a depressant and nauseant, in still smaller doses as a diaphoretic, and in the smallest as a stimulant to the stomach to check vomiting and produce appetite. Its physiological effects seem to depend on the presence of the alkaloid emetin. The root of *Cephaelis ipecacuanha* is the only thing recognized as ipecac by the British or the United States Pharmacopoeia, but the name has been applied to various other plants with emetic properties, as to the root of *Psychotria emetica*, also called *Peruvian*, striated, or black *ipecacuanha*, said to contain emetin; also to the roots of various species of *Richardsonia*, called white, amygdaceous, or undulated *ipecacuanha*. See *Turanian*.

iridium (i-ri'di-um), *n.* [NL., so called because of the varying tints of its salts when passing from one state of oxidation to the other; < *Gr. ipis* (ipid-), a rainbow: see *iris*.] Chemical symbol, Ir; atomic weight, 193. A metal of silver-white color, belonging to the platinum family, and, so far as known, always present in native platinum. Various analyses of Russian platinum give from a trace to 24 per cent. of iridium; and analyses of Californian platinum give from 0.85 to 4.20 per cent. of the same. Iridium also occurs combined with osmium, forming what is known as *iridosmium* or *iridosmine*, which also contains more or less ruthenium and rhodium. (See *iridosmium*.) Little is known of the qualities of the metal iridium, except as it has been artificially prepared; and even in this way it has never yet been obtained perfectly free from other metals. Iridium as manufactured by Matthey, to be used in the alloy of platinum and iridium, at the recommendation of the International Commission of Weights and Measures, for the standard kilogram and meter, had (the purest obtained) a specific gravity of 22.38. The alloy thus prepared, which contained about 10 per cent. of iridium, is believed to possess those qualities desirable in a standard weight or measure, which is intended to be preserved for all time, in a higher degree than any other known substance, or combination of substances. For the geographical distribution of the various members of this group of metals, see *platinum*.

It is found in minute flat scales with platinum in the Ural mountains, South America, and Australia, and also in northern California. Hence sometimes used for any messenger.

6. In *anat.*, a contractile colored curtain suspended vertically in the aqueous humor of the eye, between the cornea and the lens, separating the anterior and posterior chambers, which intercommunicate through the pupil. The iris gives the color to the eye, by the presence or absence of pigment, and regulates, by contraction and dilatation of its aperture, the amount of light admitted to the eye. The movements of the iris, and consequently the size and shape of the pupil, are effected by two sets of muscular fibers, circular and radiating. The circular fibers which contract the pupil are under the control of the third cranial nerve, while the innervation of the radiating fibers is through the cervical sympathetic. The pupil contracts when the retina is stimulated by light, and on convergence or on accommodation. The pupil dilates on stimulation of the skin. When its contraction is uniform, the pupil always remains circular, as in man; in other cases, as that of the cat, the pupil is a narrow slit when contracted, though circular when dilated; in others, again, the pupil has a more constant oval, elliptical, oblong, or other shape. Muscular action of the iris is usually automatic, depending upon the stimulus of light; but many animals, as birds, have striped and probably voluntary iridian muscles. Some drugs affect the iris powerfully and specifically; thus, opium contracts and belladonna dilates the pupil. Great as is the range of color in the human iris, from light-bluish and grayish tints through all shades of brown to blackish, it is slight in comparison with that of birds, where not only the browns, but bright reds, greens, and blues are found, and sometimes pure white. The iris of albinos is generally pink, being devoid of pigment, and consequently displaying the color of the delicate blood-vessels. The pupil normally appears black, the dark coat of the back of the eyeball being seen through this aperture. See cuts under *eye*.

In these [dark-eyed hawks] the wings are pointed, the second feather in the wing is the longest, and the *irides* are dark brown.

The pod is 3- to 6-angled. They are perennial herbs with sword-shaped or grassy leaves and generally large and showy purple, yellow, or white flowers. About 100 species are known, natives of Europe, northern Africa, and temperate Asia and America. They are widely known in cultivation under the name of *fleur-de-lis* (*flower-de-luce*). *I. It [the *iriscope*] consists of a plate of highly polished black glass, having its surface smeared with a solution of fine soap and subsequently dried by rubbing it clean with a piece of chamois-leather. If the breath is directed through a glass tube upon a glass surface thus prepared, the vapor is deposited in brilliant colored rings, the outermost of which is black, while the innermost has various colors, or no color at all, according to the quantity of vapor deposited. The colors in these rings, when seen by common light, correspond with Newton's reflected rings, or those which have black centers, the only difference being that in the plate of vapor, which is thickest in the middle, the rings in the *iriscope* have black circumferences.

2. The language of the native Celtic race in Ireland. It is in age and philological value the most important language of the Celtic family, though its antiquity and importance have been much exaggerated by tradition and patriotism. The alphabet is an adaptation of the Latin. As heretofore printed, the letters, like the so-called Anglo-Saxon letters, are usually made to resemble a conventionalized form of the Latin alphabet in use in Britain in the early middle ages. Gaelic is a comparatively recent form of the Irish spoken by the Celts of Scotland. It differs but slightly from the Irish of the same age. Modern Irish is greatly corrupted in pronunciation, as compared with the Old Irish; but it retains in great part the old orthography. As a living speech it is fast going out of use.

3. English as spoken by natives of Ireland, with characteristic peculiarities (the "Irish brogue"). In an extreme form ("broad Irish") English Irish has some Celtic features; but some peculiarities, for example *baste*, *spake*, for *best*, *speak*, etc., are merely former English uses retained in Ireland but changed in England.

ironclad (i'érn-klad), *n.* [*< iron-clad, a.*] A naval vessel cased or covered wholly or partly with thick iron or steel plates, generally having a heavy backing of wood, so armored to resist projectiles or the attacks of rams or other armored vessels. The metal armor is often of great thickness; over parts of H. M. S. Inflexible, for example, the metal is as much as 24 inches thick. Even the thickest armor used, however, is not sufficient to keep out the projectiles of the high-pressure guns of the present day; moreover, its great weight prevents the application of heavy armor except to the most vulnerable parts of the ship. The first armored vessels were built by the French for use during the Crimean war, and the success of the monitors during the civil war in the United States gave a strong impetus to the building of ironclads. Iron-clad ships are now made of very various designs. Many modern vessels have protective iron decks, but the term *ironclad* has been confined to vessels whose sides are protected. Iron-clad ships are generally armed with two or four heavy breech-loading rifled guns of from 10 to 16 inches caliber, in addition to a secondary battery of smaller breech-loading and rapid-firing guns. They are usually constructed as rams, and their hulls are divided into numerous water-tight compartments. See *battle-ship*.

No matter how strong an *iron-clad* may be, or how difficult to penetrate with shot or shell, the bottom of the ship is always a point of weakness.

Sir T. Browne, Religio Medici, i. 32.

2. In *physics*, the phenomenon of the apparent enlargement of an object strongly illuminated, when seen against a dark ground. It was explained by Plateau as due to the extension of the impression upon the nerves of the retina beyond the outlines of the image; Helmholtz, however, has ascribed it to the want of perfect accommodation in the eye, leading to the formation of diffusion images about the proper image of a bright object, so that it encroaches upon the dark space about it, and hence appears larger than it really is. Irradiation increases with the brightness of the object, diminishes as the illumination of the object and that of the field of view approach equality, and vanishes when they become equal.

irradiative (i-rā'di-ā-tiv), *n.* Something which illuminates or emits light.

irradiate (i-rā'di-kāt), *v. t.*; *pret.* and *pp. irradiated*, *ppr. irradiating*. [*< L. in, in, + radicare, radicare, take root: see radicate. Cf. eradicate.*] To fix by the root; fix firmly. *Chisold.*

Strong passion is brief madness, because the internal commotion of it, usurping consciousness, prevents full and free reflection and adaptation, and, putting the individual out of just ratio with persons and things, makes him *irrational*. *Maudsley, Mind*, XII. 510.

2. Without the quality of reason; contrary to reason; illogical; unreasonable; as, *irrational* motives; an *irrational* project.

It would be amusing to make a digest of the *irrational* laws which bad critics have made for the government of poets.

3. In *math.*: (*a*) In *arith.*, not capable of being exactly expressed by a vulgar fraction, proper or improper; surd. In *mathematics* *irrational* is a translation of Greek ἀλογος, inexpressible (by a fraction), opposed to λόγος. (See *surd*.) Every *irrational* quantity can, however, be conceived as expressed by an infinite continued fraction or terminate decimal. (*b*) In *translations* of Euclid, and cognate writings, at once incommensurable with the assumed unit and not having its square commensurable with that of the unit. This is the peculiar meaning given by Euclid to ἀλογος, though Plato uses it in sense (*a*), above. (*c*) In *alg.*, noting a quantity involving a variable raised to a fractional power; or, in a wider sense, noting a quantity not rational, not a sum of products of constants and of variables into one another or into themselves.—4. In *Gr. pros.*, incapable of measurement in terms of the fundamental or primary time or metrical unit.

II. *n.* That which is devoid of reason, as one of the lower animals.

Science, IV. 158.

irrigate (ir-i-gāt), *v. t.; pret. and pp. irrigated,*

through; moisten by a flow of water or other
liquid.

lotion during the operation, and at the dressings when it
was exposed.

act of watering or moistening; the covering of
anything with water or other liquid for the
purpose of making or keeping it moist, as in
local medical treatment; especially, the dis-
tribution of water over the surface of land to
promote the growth of plants. The irrigation of
land is often artificially effected by elaborate and costly
means, consisting of machinery for raising the water from
streams or reservoirs, and ditches through which to dis-
tribute it; and many regions depend upon such artificial
irrigation for their productiveness.

By *irrigation* is meant the application of the waters of a
running stream by a riparian proprietor in the cultivation
of his land by artificial means, and not the overflowing of
its natural banks by periodical or extraordinary freshets
or swellings of the stream beyond the customary quantity
flowing therein. *Washburn, Eas. and Serv. (3d ed.), p. 308.*

Bedwork irrigation, a method of irrigation especially

ordinary circumstances.

irritable: see irritable.] 1. The quality of being
irritable; an irritable state or condition of the
mind; proneness to mental irritation; irasci-
bility; petulance: as, irritability of temper.

Hawthorne, Seven Gables, vii.

2. In *physiol.*, the property of nerve, muscle,
or other active tissue of reacting upon stimuli;
in muscles, specifically, the property of con-
tracting when stimulated.

The *irritability* of the nerves and muscles is permanent-
ly maintained only so long as both are acted upon in their
natural positions by the circulating blood.

Lotze, Microcosmos (trans.), I. 106.

3. In *bot.*, that endowment of a vegetable organ-
ism by virtue of which a motion takes place in
it in response to an external stimulus. Such motion
may be obvious in a special organ and sudden, as in the
sensitive-plant and Venus's fly-trap, or slow, as in the coil-
ing of a tendril; or it may be internal in the protoplasm,
of which while living irritability is a fundamental prop-
erty, and from which, indeed, the outward motion proceeds.
The external stimulus may be mechanical, simply the
contact of a foreign body, or electrical, or chemical; a
sudden change from light to darkness, or a variation in
the intensity of the illumination, sometimes acts as a stimu-
lus. (*Vines, Physiology of Plants, p. 301.*) Irritability
is nearly the same as sensitiveness. See *sensitive-plant*,
protoplasm.

irritable (ir'i-ta-bl), *a.* [*= F. irritable = Sp. ir-*

tabilis, irritabilis, easily excited, < irritare, irri-
tare, excite: see irritate.] 1. Susceptible to
mental irritation; liable to the excitement of
anger or passion; irascible; petulant.

4. Responding quickly to a stimulus; sensitive; impressible.

One cannot help having an *irritable* brain, which rides an idea to the moon and home again, without stirrups, whilst some folks are getting the harness of words on to its back. *J. H. Ewing, Dandelion Clocks*.

Our modern nerves, our *irritable* sympathies, our easy discomforts and fears, make one think (in some relations) less respectfully of human nature. *H. James, Jr., Little Tour*, p. 220.

II. *n.* That which irritates or exasperates; specifically, a therapeutic agent that causes pain, heat, or tension, or a poison that produces inflammation.

irrotational (ir'ō-tā'shon-al), *a.* [*in-3* + *rotational*.] Not rotational; devoid of rotation.

The equations which form the foundations of the mathematical theory of fluid motions were fully laid down by Lagrange and the great mathematicians of the end of the last century, but the number of solutions of cases of fluid motion which had been actually worked out remained very

small, and almost all of these belonged to a particular type of fluid motion, which has been since named the *irrotational* type. *Encyc. Brit.*, III. 43.

Irrotational motion in *hydrodynamics*, of a fluid, a motion in which the infinitesimal parts have no angular velocity of rotation about their own axes—that is to say, if any infinitesimal spherical particle of the fluid were suddenly to become solidified, it would move without turning, although its path would not generally be rectilinear. Though all the particles of a fluid were moving in parallel straight lines, its motion would not necessarily be irrotational; for if parts moving side by side had different velocities, a solidified particle would rotate.

Three species, natives of tropical western Africa, are known. 1. *Barteri*, a tree 40 feet high, is the wild mango, dika-bread, or bread-tree of western Africa. The seeds are not eaten, and also contain an oil or fat similar to cocoa-butter, which is used by the natives in cooking.

Irvingism (er'ving-izm), *n.* [*Irving* (see def.) + -ism.] The system of religious doctrine and practice peculiar to Edward Irving or the Irvingites, or adherence to that system. See *Irvingite*.

Great writers, of world-wide fame, have devoted themselves to studying Gnosticism and Montanism, but scorn to bestow a thought on Quakerism, *Irvingism*, and above all on Methodism. *Contemporary Rev.*, LIV. 112.

Irvingite (er'ving-it), *n.* [*Irving* (see def.) + -ite.] A member of a religious denomination called after Edward Irving (1792-1834), a minister of the Church of Scotland, who was settled in London in 1822, promulgated mystical doctrines, and was excommunicated in 1833. Irving was not the founder of the sect popularly called after him, but accepted and promoted the spread of the principles upon which, after his death, the sect was formed. Its proper name is the *Catholic Apostolic Church*, and it has an elaborate organization derived from its twelve "apostles," the first body of whom was completed in 1835. It recognizes the orders of apostles, prophets, evangelists, pastors or "angels," elders, deacons, etc. It lays especial stress on the early creeds, the eucharist, prophecies, and gift of tongues. It has an extremely ritualistic service and an elaborate liturgy. The adherents are not numerous, and are found chiefly in Great Britain. There are some on the continent of Europe and in the United States.

is (iz). The third person singular present indicative of the verb *be*. See *be*¹. The form *is* was formerly, and is still dialectally, used for all persons of the singular, and in negro speech also for all persons of the plural. A mixture by rotating disks of 3 black, 1 bright chrome-yellow, and 2 white gives an isabel-yellow. Also *isabella*, *isabel-yellow*.

Isabella, daughter of Philip II. and wife of the Archduke Albert, vowed not to change her linen till Oct. and was taken; this siege, unluckily for her comfort, lasted three years; and the supposed colour of the archduchess's linen gave rise to a fashionable colour, hence called *l'Isabeau*, or the *Isabella*; a kind of whitish-yellow-dingy.

isinglass (i-zing-glās), *n.* [A corruption, simulating *E. glass*, of *MD. hysenblas*, later *hysenblas* (D. *husenblad* = *G. hausenblase* = *Dan. husblas* = *Sw. husbloss*, lit. 'sturgeon-bladder,' < *MD. hysen*, *hysen* = *MLG. husen* = *G. hausen*, etc., sturgeon (see *huso*), + *MLG. blase* = *G. blasen*, etc., bladder: see *blaze*⁴.] *1. The* purest commercial form of gelatin, a substance of firm texture and whitish color, prepared from the sounds or air-bladders of certain fresh-water fishes. Isinglass is manufactured especially from the sounds of some species of Russian sturgeon, and in the United States from the sounds of cod, hake, skate, sea-trout, sturgeon, and other fishes, and from the skins of some of them. An inferior quality is made from clean scraps of hide, etc., or from the purified jelly obtained from skins, hoofs, horns, etc. In the preparation of creams and jellies isinglass is in great request. It is also used in fining liquors of the fermented kind, in purifying coffee,

in making mock pearls, and in stiffening linens, silks, gauzes, etc. With brandy it forms a cement for mending broken porcelain and glass. It is likewise used as an agglutinant to glue together the parts of musical instruments, and for binding many other delicate fabrics. It is used in the manufacture of fine glues and sizes, adhesive plasters, court-plasters, diamond cement, and imitation glass, in refining wines and liquors, in adulterating milk, and in lustering silk ribbons. Grades are known as *tyre, leaf, and book isinglass*. In the East Indies, China, and Japan, isinglass, or its equivalent, is prepared from various algae or seaweeds—the same in part which furnish the material of the bird's-nests prized as a delicacy by the Chinese. Such is the origin of the important *Bengal isinglass* or *agar-agar*. Japanese isinglass is afforded by species of *Gelidium*, and is said to produce a firmer jelly than any other gelatin. These various products are used not only for food, but in the arts for stiffening, varnishing, and gluing.

2. Mica: so called from its resemblance to some forms of the gelatin.—**Book isinglass**, the commercial name for the packages into which isinglass is folded.—**Leaf isinglass**, a variety of isinglass made by cleansing, drying, and scraping the tissues of the sturgeon.—**Long and staple isinglass**, the same material as leaf isinglass, but twisted into different forms.—**Ribbon isinglass**, an inferior variety of isinglass.

Her worship in a modified form, as a nature-goddess, was introduced subsequently to the Alexandrine epoch into Greece, and was very popular at Rome from the end of the republic. The Greek and Roman priests and priestesses of Isis wore a special costume, and had as an attribute a peculiar metallic rattle, the *sistrum*.

island (i'land), *n.* [Prop. *iland*, the *s* having been ignorantly inserted in the 16th century,

The superfluous second element *land* was appar. added when the word *ig* was passing out of use; the var. *edland* (as if < *ed*, water, & land, land) was an explanatory sophistication of the proper compound *igland*. Other sophistications of the word appear in the confusion with *isle* (early mod. E. *yleland*, as if < *ile* (*isle*) & *land*), and in the MLG. MHG. form *eilant*, as if the 'land alone' (< *eim*, = E. *one*, & *lant* = E. *land*).] 1. (a) An island formed in a lake or other inland water, when of natural origin, by the aggregation of a mass of earth held together by driftwood and interlacing roots. Artificial floating islands have been formed by depositing lake- or river-mud on rafts of wickerwork covered with reeds. Both natural and artificial floating islands were used for market-gardens by the ancient Mexicans; and artificial ones, secured to the banks of rivers and lakes, abound in southern China, where they are most commonly used for raising rice. (b) A moraine of white of egg and sugar floating in divisions upon soft custard.—**Island of Reil**, in anal., a triangular cluster of cerebral convolutions (the gyri operi, or hidden gyri) situated in the Sylvian fissure, immediately out from the lenticular nucleus. J. Martens, *Aequ. Mineralium*, p. 127.

Isomorphous position, (a) A group of substances having analogous composition and closely related crystalline form. Thus, in mineralogy, the carbonates of calcium, magnesium, iron, manganese, and zinc (respectively CaCO₃, MgCO₃, FeCO₃, MnCO₃, ZnCO₃) form an isomorphous group, all crystallizing in the rhombohedral system, and with nearly the same angles, the angle of the cleavage rhombohe-

iron varying from 105° to 107°. Between the members of an isomorphous group intermediate compounds may occur, regarded as isomorphous mixtures of the two unlike molecules. Thus, dolomite, the carbonate of calcium and magnesium, may be considered as formed by the union of the calcium carbonate molecules with those of magnesium carbonate. (b) *pl. in math.* See *group*.

The thoracic legs of the females may be modified to form brood-pouches for the eggs by means of delicate membranous plates called *ostegites*. The sexes are distinct, except in *Cymothoidae*. Isopods are found in both salt and fresh water, and also on land. The terrestrial isopods, family *Oniscidae*, are known as *sow-bugs*, *wood-lice*, and *slaters*. The gribble, *Limnoria terebrans*, is a marine form. Many *Isopoda* are ectoparasitic, as the *Cymothoidae* on the gills and in the mouth of fishes, and the *Bopyridae* in the gills of prawns. The order was divided by Milne-Edwards into three sections, *Sedentaria*, *Natoraria*, and *Cursoria*, according to the habits of the animals. The title of King of Italy was assumed by Victor Emmanuel II. of Sardinia in 1861.

Italian architecture, the architectural styles developed in and characteristic of Italy; specifically, the architecture of the Italian Renaissance, which was developed through study of ancient Roman models by Brunelleschi and a few great contemporaries in the fifteenth century, and quickly disseminated its influence throughout Europe.

Italian Architecture.—Church of Sta. Maria della Salute, Venice; constructed 1632.

Among the rare merits of this architecture are its liberal application of the hemispherical dome, and the impressive proportions of many of its palace façades, which show a great projecting cornice crowning an imposing arrangement of architectural masses. Much of the carved ornament of the first decades of the style is delicate and refined; but it soon degenerated to the most offensive and pretentious vulgarity and coarseness. See *Lombard architecture* (under *Lombard*) and *Italian Gothic* (below). — **Italian cloth**, a kind of linen jean with satin face, employed chiefly for linings. — **Italian ferret**, a kind of silk braid or binding. — **Italian Gothic**, the Pointed architecture (see *Gothic*, *a.*, 3) of Italy during the thirteenth and fourteenth centuries. The style is based upon the Romanesque as developed in Italy, which does not differ essentially from the Romanesque of France and other countries, though it made more liberal use of ranges of somewhat small columns (see *cut* under *belfry*), and tended to the elaboration of surface-effects of color, owing to the abundant presence of beautifully tinted building-marbles. The Italian Pointed forms were influenced by those of northern Europe, but these were profoundly modified by the Italian architects. The exteriors of their buildings, particularly the façades, are hardly more than beautiful screens, having little or no connection with the systems of construction employed in the buildings themselves. There are no flying buttresses, for the carefully studied northern system of vaulting was never adopted in Italy: the walls are in general comparatively flat, with few projections, the rich and delicate sculpture being placed generally immediately about the windows and doors, and the large wall-spaces being treated in colored marbles, incrustation, mosaic, or painting in fresco; tracery seldom occurs in the windows, except as plate-tracery, often pierced with subtle study of effect. Every district in Italy produced its own school of Pointed architecture, each admirable in its own way. (See *Venetian architecture*, under *Venetian*.) The Pointed architecture of Sicily is not properly Italian; it approaches more closely the northern style of the Norman, French conquerors, but is affected by the Saracenic traditions which abounded on the island, and influenced by Byzantine models, particularly in its carvings and in its wealth of mosaics. — **Italian iron**, millet, etc. See the nouns. — **Italian painting**, the art of painting as developed and practised in Italy; specifically, the group of schools which had their origin in ancient Roman tradition and in the imitation of Byzantine models in the early middle ages, received their first vital impulse from Giotto in the beginning of the fourteenth century, and culminated in the great masters of the Renaissance—Tintoret, Titian, Paul Veronese, and Raphael. Until the close of the fourteenth century the consistent object of this painting was to manifest to the unlettered the miraculous things chronicled in the Holy Writ and accomplished by the sanctification of religious faith. With the fifteenth century the modern spirit of naturalism appeared in art, and made its way until by the last half of that century the religious and didactic spirit had vanished, and pictures had come to be painted in the mere cult of outward beauty, and for the personal glory and profit of the painter. For some of the chief schools of Italian painting, see *Bolognese*, *Roman*, *Sienee*, *Umbrian*, *Venetian*. See also *Florentine painting*, under *Renaissance*. — **Italian sixth**, in music, a chord of the extreme sixth, containing the major third of the bass. See *figure*. — **Italian string**, a superior kind of catgut violin-string, made in Italy. — **Italian warehouse**, a shop where Italian groceries and fruits are sold. — **Italian-warehouseman**, a dealer in fine groceries, including macaroni, vermicelli, dried fruits, olive-oil, etc.

The hard substance, not unlike bone, of which the teeth of most mammals chiefly consist; specifically, a kind of dentine valuable for industrial purposes, as that derived from the tusks of the elephant, hippopotamus, walrus, narwhal, and some other animals. *Ivory* is simply dentine or tooth-substance of exceptional hardness, toughness, and elasticity, due to the fineness and regularity of the dentinal tubules which radiate from the axial pulvity to the periphery of the tooth. The most valuable *ivory* is that obtained from elephants' tusks, in which the tubules make many strong bends at regular intervals, resulting in a pattern peculiar to the proboscidean mammals. In its natural state the *ivory* of a tusk is coated with cement; and besides the fine angular radiating lines, it shows on cross-section a series of contour-lines concentric with the axis of the tooth, arranged about a central grayish spot which represents the calcified pulp. The appearance of these contour-lines is due to the regular arrangement of minute spaces called *interglobular*. *Ivory* in comparison with ordinary dentine is especially rich in organic matter, containing 40 per cent. or more. Tusks of extinct mammoths, furnishing fossil *ivory*, have been found 12 feet long and of 200 pounds weight. Those of the African elephant, furnishing the best *ivory*, as well as by far the greater portion of the *ivory* used in the arts, sometimes reach a length of 9 feet and a weight of 160 pounds. Those of the Indian elephant are never so large as this; and in either case tusks average much smaller, probably under 50 pounds. Elephants' tusks are incisors, but the large teeth of the hippopotamus and walrus which furnish *ivory* are canines. A substance which sometimes passes for *ivory*, but is really bone, is derived from the very hard or petrosal parts of the ear-bones of whales.

A rotating color-disk composed of 1 white, 1 bright chrome-yellow, and 1 emerald-green will give what is called *ivory-yellow*. The mixture of chrome-yellow and green in these proportions without

the white would appear as a lemon-yellow cooler than gamboge; but the handsomest *ivory*-yellow is a little whiter.

(*H. Helix*), natural order *Araliaceæ*, and the type of the series *Hedereæ*. The leaves are smooth and shining, varying much in form, from oval entire to 3- and 5-lobed; and their perpetual verdure gives the plant a beautiful appearance. The flowers are greenish and inconspicuous, disposed in globose umbels, and are succeeded by deep-green or almost black berries. *H. Helix* (the common *ivy*) is found throughout almost the whole of Europe, and in many parts of Asia and Africa. It is plentiful in Great Britain, growing in hedges and woods, and on old buildings, rocks, and trunks of trees. A variety called the *Irish ivy* is much cultivated on account of the large size of its foliage and its very rapid growth. The *ivy* attains a great age, the stem ultimately becoming several inches thick and capable of supporting the weight of the plant. The wood is soft and porous, and when cut into very thin plates is used for filtering liquids. In Switzerland and the south of Europe it is employed for making various useful articles. The *ivy* has been celebrated from remote antiquity, and was held sacred in some countries, as Greece and Egypt.—**American ivy**, *Ampelopsis quinquefolia*.—**Barren ivy**, a creeping and flowerless variety of *ivy*.—**Black ivy**, the common *ivy*, *Hedera Helix*, also named *H. nigra*: so called in allusion to its sometimes nearly black berries.—**German ivy**, a species of groundsel, *Senecio mikanioides*.—**Indian ivy**, a plant of the genus *Scindapsus*, natural order *Araceæ*. This word, very common in Middle English, lost somewhat of its literal force, and became in later use a term of slight emphasis, often meaningless. In the later ballads, and hence archaically in modern use, it is thrown in parenthetically, often as a metrical expletive, and is commonly printed as two words, *I wis*, taken to mean 'I think' or 'I guess.' They have narrow sword-shaped leaves, and slender simple or branched stems, bearing spikes of large, showy, variously colored flowers. The beauty and elegance of the flowers give them a high place among ornamental plants. The plant formerly called *Ixia* (*Pardanthus*) *Chinensis* is now referred to a genus *Belamcanda*.

They are flat in the normal state, but swell up when distended with blood, becoming more or less globular. They adhere very firmly to the skin of man and beasts, requiring some force to pull them away, but if undisturbed drop off upon reptile. *I. ricinus*, the dog-tick of Europe, is a characteristic example. One of the best-known in the United States is *I. abietis*, the white-spotted tick. See cut under *Acarida*.

Ixodidae (ik-sō-dī-dē), *n. pl.* [*Gr. Ixodes* + *-idae*.] A family of tracheate *Acarida*, typified by the genus *Ixodes*, and comprising all those mites which are properly called ticks. The skin is tough and leathery, and in the female capable of great distention. The rostrum and mandibles are fitted for sucking, and the tarsi have two claws and a sucking-disk. In the early stages the *Ixodidae* are herbivorous and not parasitic; but the adults fasten themselves to various animals and suck blood. There are about 12 genera, and the species are numerous.

ixolite (ik'sō-lit), *n.* [*Gr. ἰξός*, birdlime (see *Ixia*), + *λίθος*, a stone.] A mineral resin of a greasy luster found in bituminous coal, which becomes soft and tenacious when heated. Also, erroneously, *ixolyte*.

Ixonanthes (ik-sō-nan'thēz), *n.* [*NL.* (Jack, 1820), irreg. < *Gr. ἰξός*, birdlime, mistletoe (see *Ixia*), + *άνθος*, flower.] A small genus of smooth trees, of the natural order *Linaceae*, type of the tribe *Ixonanthæ*, having the petals 10 to 20 in number and perigynous, and the fruit often with false partitions. They have alternate, coriaceous, entire or remotely crenate serrate leaves, and small flowers in usually axillary dichotomous cymes. The three or four species known are natives of tropical eastern Asia.

Ixora (ik'sō-rä), *n.* [*NL.* (Linnaeus), < *Iswara* (< *Skt. iṣvara*, master, lord, prince, < *√ iṣ*, own, be master; cf. *AS. āgan*, *E. once*), given as the name of a Malabar deity to whom the flowers are offered.] 1. A genus of plants of the natural order *Rubiaceae*, type of the tribe *Ixoreae*. It consists of tropical shrubs or small trees, chiefly of the old world, numbering about 100 species. The flowers have the corolla salver-shaped, contorted, the stamens exserted; and they are disposed in trichotomously branching corymbs. The leaves are coriaceous and evergreen. Many species are cultivated, for the elegance, and in some cases fragrance, of their flowers. Several species have a medicinal use. Certain species, very hard-wooded, are called *iron-trees*. *I. ferrea* of the West Indies is called *hardwood-tree* or (with other species) wild *jasmine*. *I. triflorum*, a native of Guiana, is called *hackia*. Two extinct species have been discovered in the Tertiary deposits of Europe, and three other closely allied forms from a bed of the same age on the island of Labuan, off the coast of Borneo, have been described under the name *Ixorophyllum*.

2. [*l. c.*] A plant of this genus.

Ixoreae (ik-sō-rē-ē), *n. pl.* [*NL.* (Bentham and Hooker, 1873), < *Ixora* + *-eae*.] A tribe of plants of the natural order *Rubiaceae*, of which the genus *Ixora* is the type, and to which the coffee-plant belongs. It includes 11 genera, natives of the tropics of both hemispheres. The plants of this tribe are trees or shrubs with entire stipules, and are chiefly distinguished from those of other tribes by having the lobes of the corolla twisted instead of imbricated or valvate in the bud.

-ize. [*Also -ise*; = *F. -iser* = *Sp. Pg. -isar*, *-izar* = *It. -izzare*, < *LL. ML. -izare*, < *Gr. -ίζειν*, a common formative of verbs denoting the doing of a particular thing expressed by the noun or adjective to which it is attached, as in *Ἀθηναίειεν*, speak or act like the Athenians, *Ἀττικίζειεν*, *Ἀλαβανίζειεν*, speak or act like the Spartans, *Λακωνίζειεν*, speak or act like the Spartans, *Λακωνίζειεν*, speak or act for Philip, philippize, etc., *ἐλπίζειεν*, have hope, < *ἐλπίς*, hope. Some verbs with this suffix, as *βαπτίζειεν*, baptize, are practically mere extensions of a simpler form (as *βάπτειεν*). To this suffix are ult. due the *E.* suffixes *-ism* and *-ist*; from the parallel form *-ίζεω* come *-asm* and *-ast*.] A suffix of Greek origin, forming, from nouns or adjectives, verbs meaning to be or do the thing denoted by the noun or adjective. It occurs in verbs taken from the Greek, as in *Ἀθηναίειεν*, to be, act, or speak like an Athenian, *Λακωνίζειεν*, to be, act, or speak like a Spartan, *φιλιππίζειεν*, to act or Philip's side, etc. (also in a few whose radical element is not recognized in English, as *baptize*), and in similar verbs of modern formation, mostly intransitive, but also used transitively, as in *criticize*, to be a critic, *philosophize*, to be a philosopher, etc., *botanize*, *etymologize*, *geologize*, etc., to study or apply botany, etymology, geology, etc. It is also used causally, as in *civilize*, make civil. It is very common in verbs denoting to do or affect in a particular way something indicated by the noun to which it is attached, this being often a person's name, referring to some method or invention, as *bowlerize*, to expurgate in Bowler's fashion, *grangerize*, to treat (books) after the example set by Granger, *macadamize*, to make a road after MacAdam's method, *burnettize*, to impregnate with Burnett's liquid, etc. In this use it is applicable to any process associated with the name of a particular person or thing, being often used for the nonce for humorous effect, or confined to special trade use. It is sometimes attached without addition of force to verbs already transitive, as in *jeopardize*, for *jeopard*, or where the noun may properly be used as a verb, as in *alphabetize*, for *alphabet* (verb). In spelling, usage in Great Britain favors *-ise* in some verbs, as *civilise*, but usage there makes most new formations in *-ize*, which is the regular American spelling in nearly all cases. Verbs in *-ize* are or may be accompanied by nouns of action in *-ization*, as *civilize*, *civilization*. Such verbs, especially those taken from the Greek, as *Ἀττικίζειεν*, *Λακωνίζειεν*, may have a noun of action or state in *-ism*, as *Ἀττικισμός*, and a noun of agent in *-ist*, as *Ἀττικιστής* (see *-ism* and *-ist*). The termination *-ize* as a variant of *-ise* in nouns, as in *merchandize*, is obsolete; as a variant of *-ise*2 equivalent to *-ize*2, as in *advertise*, *divertise*, it is obsolete or treated as *-ize* above.

"hard *e*," "hard *g*," but evidence of *s hard* as a current name for *s* is lacking. The old name is *zed*, still used in Great Britain; the name now current in the United States is *ze*.] A former name of the letter *Z*.

Harper's Mag., LXXVI. 788.

izzard2, *n.* See *izard*.

1. The tenth letter in the English alphabet. The character is only another form of *i*, the two forms having been formerly used indifferently, or *j* preferred when final or affording a terminal flourish (as in writing the numerals, *iiij*, etc.: see 2). The differentiation in use was established about the year 1680. In Latin, for example, *i* was written where we write

both *i* and *j*—e. g., *juris* instead of *juris*—and had now the vowel-value of *i* (see *i*), and now the consonant-value of *y* (see *y*), being pronounced as *y* where we now write and pronounce *j*. The only quasi-English word in which we now give it such a value is *hallelujah* (better written *halleluia*); elsewhere, *j* is written only where the original *y*-sound has been thickened into the compound *dzh*, the sonant counterpart of the *ch*-sound, and identical with what we call the soft sound of *g* (see *g*); and, with a consistency very rare in English orthography, it has always (with the exception mentioned above) this value and this only. It occurs chiefly in words of Latin descent, being found only exceptionally, as a late variant, of *ai* (Anglo-Saxon *e*), in words of Anglo-Saxon descent (see *ja*, *jark*, *jous*). Owing to the equivalence in Latin of *i* and *j*, words beginning with these letters (as those beginning with *u* and *v*) respectively have, notwithstanding their great difference in pronunciation, only within a short time been separated in dictionaries. They are not separated in Bailey (1721–1755 and later), nor in Johnson (1755), nor in Todd's revision of Johnson (1818), nor in Nares's Glossary (1822; ed. Halliwell and Wright, 1859). 2. (a) As a numeral, a variant form of *I*: used chiefly at the end of a series of numerals, and now only in medical prescriptions: as, *vj* (six); *viii* (eight). Also there was a grett Vesell of Sylver, And it had at every ende rounde rymys gylte and it was *viij* cornards. *Torkington*, *Diarie of Eng. Travell*, p. 13. (b) In *math.*, *j* stands for the second unit vector or other unit of a multiple algebra. *J* usually denotes the Jacobian. (c) In *thermodynamics*, *J* is the mechanical equivalent of heat (being the initial of Joule).—*J* function. See *function*.

F. *Jaques*, a very common personal name, James, Jacob, = Sp. *Jago* (formerly written *Jago*), also *Diego* = Pg. *Diego*, these being reduced forms of the name, which appears also, in semblance nearer the LL., as *E. Jacob* = F. *Jacobe* = Sp. *Jacobo* = It. *Giacobo*, *Giacobbe*, *Jacopo*, and with altered term. (b to m), It. *Giacomo*, *Jachimo* = Sp. contr. *Jaime* = Pg. *Jayme* = OF. *Jakemes*, contr. *Jaime*, *Jams*, *James*, >

'one who takes by the heel,' a supplanter, < 'aqab, take by the heel, supplant (see Gen. xxv. 26, xxvii. 36). The name *Jack* is thus a doublet of *Jake* (still used as a conscious abbr. of *Jacob*, and occasionally in the same general sense as *Jack*, as in *country jake*, applied in the U. S. to a rustic), as well as of *James*, all being reduced forms of *Jacob*; but on passing into E. *Jack* came to be regarded as a familiar synonym or dim. of *John* (ME. *Jan*, *Jon*, etc., dim. *Jankin*, *Jenkin*, etc.), and is now so accepted. The F. name *Jaques*, being extremely common, came to be used as a general term for a man, particularly a young man, of common or menial condition; so E. *Jack*, and its synonym *John*, which is similarly used, in its various forms, in other languages. From this use of *Jack*, as equiv. to 'lad, boy, servant' (cf. *jock*, *jockey*), has arisen its mod. E. use as a purely common noun, alone or in comp., applied to various contrivances which do the work of a common servant or are subjected to rough usage. Cf. *billy*², *jenny*¹, *Jimmy*¹, *betty*, etc., likewise from familiar personal names, *jenny* or *Jimmy* being ult. identical with *jack*.] 1. This is effected by means of an endless screw working into the worm-wheel *c*, which forms the nut of the screw. On the lower end of the screw is fixed the claw *d*, passing through a groove in the stock; this claw serves at once to prevent the screw *b* from turning and to raise bodies which lie near the ground. A light jacket: a garment having but slight value as a defense against weapons.—2. A short coat or body-garment; any garment for the body coming not lower than the hips. Jackets for boys throughout the first half of the nineteenth century came only to the waist, whether buttoned up or left open in front, and a similar garment is still worn by men in certain trades or occupations. Short outer garments designed for protection from the weather and worn by men of rough occupations are called by this name: as, a monkey-jacket. Compare *zouave-jacket*, *smoking-jacket*.

3. A waistcoat or vest. [Local, U. S.].—4. Something designed to be fastened about or over the body for some other purpose than that of clothing: as, a strait-jacket, or a swimming-jacket.—5. Clothing or covering placed around a cylindrical or other vessel of any kind, as a pipe, a cannon, a steam-boiler, a smoke-stack where it passes through the deck, etc., to give greater power of resistance, to prevent escape of heat by radiation, etc. Felt, wool, mineral-wool, paper, wood lagging, asbestos, and many other materials are in common use for jacketing steam-cylinders and -pipes, and pipes, tanks, etc., in which it is desirable to prevent freezing. Air-compressor cylinders are usually supplied with water-jackets for cooling the cylinders, which would otherwise become very hot from heat absorbed from the air, the work of compression being converted into heat in the compressed air, which thus acquires a high temperature. These cylinders are inclosed in metal shells which leave an annular space between them and the cylinder, and through this space cool water is kept constantly flowing by the aid of a pump or other device. When a steam-cylinder is thus inclosed, and the annular space is supplied with live steam, the arrangement is called a *steam-jacket*. The condensation which would otherwise occur in the cylinder during the periods of induction and expansion is thus prevented, and a considerable economy is effected. See cut under *air-engine*.

jade² (jād), *n.* [*F. jade*, < *Sp. jade*, *jade*, orig. "*pedra de yjada*, pierre bonne contre le colique" (Sobrinho, Diccionario, ed. 1734), a name given (like the later equiv. *nephrite*, q. v.) because the stone was supposed to cure pain in the side: *Sp. piedra*, < *L. petra*, stone; *de*, of; *yjada*, now spelled *yjada*, the side, flank, pain in the side, colic, < *L. as* "*iliaca*, < *ilium*, *ileum*, usually in pl. *ilia*, the flank, the groin: see *iliac¹*.] A tough compact stone, varying from nearly white to pale or dark green in color, much used in prehistoric times for weapons and utensils, and highly prized, especially in the East, for ornamental carvings. Two distinct minerals are included under the name. One of these is *nephrite*, a closely compact variety of hornblende (amphibole), classed with tremolite when nearly white and with actinolite when of a distinct green color; it is fusible with some difficulty, and has a specific gravity of from 2.9 to 3. The other is *jadeite*, which is silicate of aluminium and sodium, analogous in formula to spodumene; a variety of a dark-green color and containing iron has been called *chloromelanite*. It is more fusible than nephrite, and has a higher specific gravity, viz. 3.3. This is the kind of jade most highly valued. Its translucency and color, varying from a creamy white to a different shade of delicate green, give great beauty to the vases and other objects carved from it. The Chinese, who have long made use of jade for rings, bracelets, vases, etc., call it *yu or yu-shih* (jade-stone). A variety of jadeite having a pale-green color is called by them *fei ts'ui*, or kingfisher-plumes. The best-known locality from which jade has been obtained is the Kara-Kash valley in eastern Turkestan. Jade implements have been found in considerable numbers among the relics of the Swiss lake-dwellers, but it is generally believed that the material was brought from the East; they are also found in New Zealand, in the islands of the Pacific, in Central America, Alaska, and elsewhere, and the facts of their distribution are of great interest in ethnography. (See cut under *az*.) The word *jade* is sometimes extended to embrace other minerals of similar characters and hence admitting of like use, as zoisite (saurussite, the jade of De Saussure and *jade tenace* of Haiyi), fibrolite, a kind of serpentine, and others. Also called *az-stone*, and by the Maoris of New Zealand *pounamu*. *Oceanic jade*, a name given by De la Roche to a fibrous variety of jade found in New Caledonia and in the Marquesas Islands, having a specific gravity of 3.18, and differing from ordinary nephrite in the proportion of lime and magnesia which it contains.

Under the main tower are placed the three idols. Great multitudes of pilgrims come from all quarters of India to pay their devotions at his shrine. On these occasions the idol is mounted on an enormous car—the car of Juggernaut—resting on massive wooden wheels, and drawn by the pilgrims. Japanese (jap-a-nēs' or -nēz'), *a.* and *n.* [*< F. Japonais* = *It. Giapponese*, etc.; as *Japan* + *-ese*.] 1. *a.* Pertaining to Japan or its inhabitants.—*Japanese art*, the art of Japan, an original, consistent, and strictly national development, noteworthy chiefly in the departments of industrial and of decorative art. The productions of this art are characterized by fitness for their purpose and constructive soundness, and exhibit at once delicacy of touch and freedom of hand. In architecture the groundwork is plain and simple, the

models not differing greatly from those of neighboring Asiatic countries. But the decoration shows the true artistic spirit; there is richness of carving, inlaying of bronze, gold, and precious woods, and brilliant color, but no excess or heaviness, and no masking of structural elements. In painting and the kindred arts the highest study, that of the human figure, has not been mastered; but the refined and true drawing of animals and plants, with accurate representation of swift motion, and the harmonious use of color, are alike remarkable. In sculpture, especially in bronze and wood, the same subjects are treated with the same qualities and the same success. The technique of the Japanese bronzes especially has never been attained by other peoples. Lacquered ware, embossed in gold and colors, represents another industry in which the Japanese are unrivaled. Their pottery and porcelain, though of great beauty, is perhaps excelled by that of the Chinese. In textile fabrics, embroidery, wall-papers, etc., the exactness of observation and mastery of technical rendering alike of Japanese artist and workman produce admirable results.—*Japanese bantam*, a quaint ornamental variety of bantam with short yellow legs, and plumage white with the exception of the tail, which is black. The tail is very large, and is carried so upright that in the cock it almost touches the head; and the wings droop so as nearly to reach the ground.—*Japanese box*. Same as *Chinese box*. See *Eunonymus*.—*Japanese cypress*, one of various species of *Chamaecyparis*.—*Japanese deer*, *Cervus sika*.—*Japanese elm*. Same as *kaaki*.—*Japanese ivy*. See *ivy*.—*Japanese long-tailed fowls*, a breed of the domestic hen developed in Japan, similar in form to a game or small Malay, but characterized by the remarkable length of the trailing sickle-feathers of the cock, which frequently attain six or seven feet, and sometimes much more. Also known as *Phœnix*, *Shinotawaro*, or *Yokohama fowls*.—*Japanese pasque-flower*, *persimmon*, *quince*, *silk*, *yam*, etc. See the nouns.

E. *chawe*, *chaw*, *jaw* (= OD. *kawne*, the jaw of a fish (Hexam), *kouwe*, the cavity of the mouth, = Dan. *kjave*, the jaw); appar. < ME. *cheowen*, *chewen*, mod. E. *chew*, *chaw* = OD. *kouwen*, etc., *chew*. The form may have been affected by association with *jowl*, ME. *jolle*, *chaul*, etc., and perhaps with F. *joue*, *cheek*.] 1. One of the bones which form the skeleton or framework of the mouth; a maxilla or mandible; these bones collectively. The jaws in nearly all vertebrates are two in number, the upper and the lower. The upper jaw on each side consists chiefly of the superior maxillary or supramaxilla, and of an intermaxillary bone or premaxilla, both of which commonly bear teeth in mammals, reptiles, batrachians, and some fossil birds. The lower jaw in mammals is a single bone, the inframaxillary, inframaxilla, or mandible, or one pair of bones united at the middle line by a symphysis. In vertebrates below mammals this bone is represented by several pieces, its bony elements becoming quite complex in birds and most reptiles and many fishes. The mandible, and especially its terminal element when there are several, commonly bears teeth like the upper jaw. As a rule, it is movably articulated with the rest of the skull. In mammals this articulation is direct, and is known as the *temporomaxillary*. In birds it is indirect, by intervention of a quadrate bone; and in the lower vertebrates various other modifications occur. See cuts under *Cyclopus*, *Gallina*, *Pelida*, and *skull*. These Serpentes slen men, and thei eten hem wepyng; and whan thei eten, thei meven the over *Jowe*, and noughte the nether *Jowe*; and thei have no Tonge. Mandeville, Travels, p. 288.

2. The bones and associated structures of the mouth, as the teeth and soft parts, taken together as instruments of prehension and mastication; mouth-parts in general: commonly in the plural. In most invertebrates, as insects and crustaceans, the jaws are much complicated, and consist essentially of modified limbs, maxilliped, gnathopod, or jaw-feet; and the opposite parts work upon each other sidewise, not up and down. Often used figuratively. See cut under *mouth-part*.

Jehovah (jē-hō'vā), *n.* [The common European spelling (with *j = y* and *v = w*) of *Yehōwāh* or *Yahōwāh*, the Massoretic form of the Hebrew name previously written without vowels JHVH (YHWH), the vowels of *Adōnāi* (which see) being substituted by the later Jews for those of the original name, which came to be regarded as too sacred for utterance. The original name, according to the view now generally accepted, was *Yahweh*, or rather *Yahwe*, the name appearing also contracted *Yāh*, separately (see *halleluiah*), or, as *Yāh* (*Jāh*: see *Jah*), *Yō*, *Yehō*, *Yāhu*, in compound proper names (as, in E. forms, *Isaiah*, *Jeremiah*, etc., *Joshua*, *Jeshua*, *Jesus*, *Jeshusha*: see *Jesus*), transliterated in late Greek variously 'Iaβē', 'Iavē', 'Iaovē'. The origin and meaning of the name are unknown. It was formerly referred to the Hebrew root *hāvah*, be, exist, and was taken to imply self-existence, 'he that is' ('I am that I am,' Ex. iii. 14; more correctly 'I shall be what I shall be'), or else eternity. Some modern scholars would translate the name as 'he who causes to be,' i. e. the Creator, while others connect it with an Aramaic sense 'fall,' as if 'he who causes (rain or lightning) to fall,' this explanation being paralleled by similar terms associated with the Greek Zeus. Others, in view of the fact that a metaphysical notion like 'self-existence' does not elsewhere appear in the names of the deities of primitive peoples, regard the Hebrew derivation as a piece of popular etymology (something like that which in English associates the name *God* with *good*), and seek to identify *Yahwe* with some Assyrian or other foreign deity.] **1.** In the Old Testament, one of the names of God as the deity of the Hebrews: in the English version usually translated, or rather represented, by "the LORD." And I appeared unto Abraham, unto Isaac, and unto Jacob, by the name of God Almighty, but by my name JEHOVAH was I not known to them.

erts of Africa, living in communities in extensive and intricate underground galleries. The hind legs of the animal are extremely long, and so great is its power of jumping that it seems hardly to touch the ground as it bounds along. 3. A court-fool or professed sayer of witty things and maker of amusement, maintained by a prince or noble in the middle ages and later. The dress of the jester was usually showy, or even gaudy, and toward the end of the time when jesters were employed it was always typically party-colored or motley; but, as the jesters in some early courts were men of considerable intellectual ability, and in some cases of good family, their dress was not always conspicuously distinguished from that of those with whom they mingled. The bauble, sometimes very small and of rich materials, was the only certain badge of the jester's employment. The fools of Shakespeare's plays indicate a certain lowering of the rank of the jester in the sixteenth and seventeenth centuries. So far as is known, the last one employed in England was Archie Armstrong (died 1672), in the court of James I., and afterward of Charles I. See *cockcomb, bauble's motley*.

Jesuate (jēz'ū-āt), *n.* [Also *Jesuat*, < *It. Gesuato*, < *Gesu*, Jesus: see *Jesus*. Cf. *Jesuit*.] A

member of a monastic order founded by the Italian Colombarini, and confirmed by Urban V. about 1367. Until 1606 it was composed entirely of laymen, who cared for the poor and sick. From the fact that they distilled alcoholic liquors at some of their houses, they were called *Aqua-vitæ fathers*. The order was suppressed in 1668.

Jesuit (jēz'ū-it), *n.* [*< F. Jesuite*, now *Jésuite* = *Sp. Jesuita* = *Pg. Jesuista* = *It. Gesuita* = *D. Jesuit*, *Jesuit* = *G. Dan. Sw. Jesuit*, < *NL. Jesuita*, so called (first, it is said, by Calvin, about 1550) from the name given to the order by its founder (*NL. Societas Jesu*, 'the Company (or Society) of Jesus'), < *L. Jesus* + *-ita*, *E.* usually *-itē*.]

1. A member of the "Society of Jesus" (or "Company of Jesus"), founded by Ignatius Loyola in 1534 and confirmed by the Pope in 1540. Its membership includes two general classes, laymen, or temporal coadjutors, and priests; and six grades, namely, novices, formed temporal coadjutors, approved scholastics, formed spiritual coadjutors, the professed of three vows, and the professed of four vows. The applicant for admission to the order must be at least fourteen years old, and the three vows cannot be taken before the age of thirty-three. After a two years' novitiate the lay brothers become temporal coadjutors, and the candidates for the priesthood are advanced to the grade of scholastics. A rigorous course of study follows for fourteen or fifteen years, divided into three nearly equal periods of academic or collegiate study, teaching and study combined, and a course in theology. At the end of this time the scholastic enters on another short novitiate, after which he may become either a spiritual coadjutor or one of the professed. The three vows are voluntary poverty, perfect chastity, and perfect obedience; and the fourth vow is absolute submission to the Pope. The professed of the four vows are the most influential class; they form the general congregation, and fill the highest offices and the leading missions. The general is elected for life by the general congregation. He has great power, limited only by the constitutions, and is aided by a council of assistants. He must reside at Rome, and is subject only to the Pope. There is an elaborate organization, with a division into five "assistancies" subdivided into provinces, each of which is administered by a provincial, and each provincial has "superiors," rectors, etc., as subordinates. Two features characterize the system, thus organized—absolute obedience and a perfect system of training. It is the combination of these two principles which has made the order of Jesuits such a power in the church. So formidable has their political influence been supposed to be that they have often been expelled even from Roman Catholic communities. They were expelled from France in 1594, restored in 1603, again expelled in 1764, and for the last time in 1880. They were expelled from Spain in 1767, and at different times from various other countries. In 1773 the order was suppressed by Pope Clement XIV., but it was revived in 1814. It is believed now to number about ten thousand members.

connected with another. Pieces of timber are framed and joined to one another generally by mortises and tenons, of which there are several kinds, as by iron straps and bolts. (f) In *bookbinding*, the flexible cloth or leather which, serving as a hinge, connects the back of a book with its

sides. (g) The junction of two portions of an electrical conductor, such as a telegraph-wire or cable-core. [Joints made between materials in masonry, carpentry, plumbing, and in other arts have received in many instances names that are compounds of the word *joint* with others that describe the position of the parts, as *angle-joint*, *butt-joint*, etc.; or the manner of forming the joint, as *dovetail-joint*, *rivet-joint*, *scarf-joint*, *dowel-joint*, etc. Most of these joints are clearly defined by their names.]

2. In *geol.*, a crack intersecting a mass of rock. Beds of considerable thickness, especially when homogeneous and somewhat crystalline, are frequently found to be traversed by a great number of fissures, nearly parallel with one another, and often very straight and regular in their course. Sometimes there are two systems of these joints, each set consisting of parallel fissures, and the two sets being at right angles, or nearly so, with each other. There may be even three systems of joint-planes, but in any case one set is almost always more decidedly well formed than the others. The cleat of coal is an illustrative example of the occurrence of a well-developed jointing; the distinctive scenery of certain picturesque limestone regions—as, for instance, that of the north of England—is due to the peculiar form of weathering caused by well-defined systems of joint-planes. The character and relative position of the systems of joints in rocks are of great practical importance from various points of view, and especially with reference to the facility with which the rock may be quarried into forms convenient for use. The jointing of granite is frequently such as to divide the rock naturally into cuboidal masses. The prismatic jointing of volcanic masses is frequently very perfectly and beautifully marked. See *basalt*.

Joint-stock company. (a) An association the property or capital of which is represented by stock issued in shares to the members respectively, the object being that changes in membership shall depend, not, as in partnership, upon the consent of all the members, but upon the transfer of shares, which any member may make without the consent of the others, and also that the death of a member shall not dissolve the association, as in case of a partnership, his right being simply transferred to his executors or administrators. Another object usually if not always involved is the rendering of the power of control separable from the right of ownership, by vesting the management in a committee or officers instead of leaving it, as in the case of a partnership, with each member. In the absence of any statute the liability of a joint-stock company and its members, and its means of enforcing its rights as to third persons, are nevertheless precisely those of partners: all the members must join in suing; all are liable for its debts, and all must be joined when sued; and on a change of membership pending a suit a corresponding change of parties may be required. To obviate these inconveniences, statutes have been passed in several of the United States allowing such associations to sue and be sued in the name of the president or treasurer. In respect to internal controversies, the courts, even without the aid of statute, follow the analogies afforded by the law of corporations, so far as this can be done without conceding to unincorporated associations the right to have a common seal, and to have succession and sue and be sued as a distinct artificial person. (b) An association for similar objects, but having

the express sanction of statute for its organization as a corporation. In both classes of companies the members contribute.—**Joint-stock Companies.** *See* *British statutes prescribing methods for the organization, management, and winding up of incorporated companies other than banking concerns.*

The eggs are laid in the stems of these cereals, and the larva feed in slight enlargements near the joints. There is only one annual generation, and the insect winters in the stubble in both the pupal and adult states. All the species of *Isosoma* are phytophagous or plant-feeding, and work like *I. hordei* upon the stalks of various grasses and cereals. These worms are of small size, one tenth to one fifth of an inch long. They attack the crop when it is a foot or less in height, checking the growth, causing the green leaves to turn yellow, and making knots on the stem. The rye joint-worm is the larva of *I. secalis*; the wheat joint-worm, that of *I. tritici*; both of these are merely varieties of *I. hordei*, which is more fully called *barley joint-worm*. *See* *Isosoma*.

In that year the land was not tilled, all lands that had been sold were restored to the original owners or their heirs, and all bondsmen of Hebrew blood were liberated. The period was shortened successively to fifty, thirty-three, and twenty-five years, and certain works of charity and devotion were substituted for the pilgrimage to Rome.

A man who is no *judge* of law may be a good *judge* of poetry or eloquence, or of the merits of a painting. *Dryden*.

6. In *Jewish hist.*, an administrative officer who stood at the head of the Hebrew state in the intermediate period between the time of Moses and Joshua and that of the kings. These officers were generally military leaders, without any regular transmission of their authority, not supreme magistrates succeeding to the rule of Moses and Joshua. None of the judges had authority over all the tribes, and sometimes two or more were contemporaneous.

And it came to pass, when Samuel was old, that he made his sons *Judges* over Israel. *1 Sam.* viii. 1.

7. [*cap.*] *pl.* The seventh book of the Bible, properly the "Book of Judges" (*Liber Judicum*, Vulgate). It contains the history of the Israelites un-

der the administration of the judges from the death of Joshua to about the time of the birth of Samuel. The date and authorship are unknown. Some critics regard Samuel as the author; others find traces of several authors or compilers, and place the final revision as late as the eighth century B. C.

8. In coal-mining, the measuring-rod with which the depth of a holing or jad is ascertained.

[Eng.]—Associate judge, the designation usually given to each of the judges of a court other than the chief or presiding judge.—Chief judge, a judge who presides over the sessions and deliberations of a court. The office of chief judge is often a distinct office, having a slightly higher salary; but in some cases the position belongs to the member of the court who may be chosen by his associates, or who is entitled to it by virtue of seniority in office.

Circuit judge. (a) The judge of a circuit court; specifically, in the United States, the judge appointed to preside over one of the nine circuits into which the country is divided. A circuit court is commonly held by him with the district judge, or with a justice of the Supreme Court; but it may be held by any one of the three alone, or by any two together. Formerly the justice of the Supreme Court allotted to a circuit was called the *circuit judge*. (b) The term has sometimes been employed to designate a special judge, or one of a class of special judges, added to a court for the purpose of holding trials, but without being a member of a court in banc.—City judge, the usual title in the United States of a local magistrate having criminal or civil jurisdiction, or both, within the limits of a city.—County judge, a local magistrate having a limited jurisdiction within a county.—District judge, a judge whose jurisdiction is confined to a particular district; specifically, in the United States, the judge of a district court in one of the numerous districts into which the country is divided for judicial purposes, there being usually two or more districts within each State.—Judge ordinary, in England, formerly, the judge of the Court for Divorce and Matrimonial Causes.—Judges' chambers. See *chambers*.

—Lay judge, a judge who is not a lawyer.—Municipal judge. Same as *city judge*.—Presiding judge. (a) The judge for the time being holding a court or presiding in a court. (b) A chief judge.—Probate judge, or judge of probate, a judge having jurisdiction of testamentary causes; a surrogate.—Puisne judge, a junior judge: the title formerly used in the English superior courts of common law for a judge other than the chief judge.—Side judge, a designation sometimes given to a magistrate, or each of two magistrates, of inferior rank, associated with a magistrate of higher grade for the purpose of constituting a court.—Trial judge, the judge before whom a cause is tried: used particularly in appellate courts to designate the judge whose rulings are brought under review. = *Syn.* 1 and 3. *Judge, Umpire, Referee, Arbitrator*; justice, arbiter. *Judge* is a technical word for a legal officer with duties clearly defined: as, a judge of probate; or a general word for a person empowered to arbitrate or award: as, to act as judge at contests, an exhibition of paintings, a competitive examination, etc. *Umpire* is a name applied to the person selected to decide all disputed points connected with a public contest: as, the *umpire* in a game of baseball. *Referee* is somewhat more loosely used. In legal usage *referee* means one to whom a pending cause or some branch of it is referred, with the sanction of the court, to act in place of the judge, or in aid of his determination, the result being a decision of the court; while an *arbitrator* is one to whom a question is referred simply by agreement of the parties, without sanction of the court. The reference of a pending cause to an *arbitrator* takes it out of court, and precludes further proceedings in court. In a boxing-match, boat-race, foot-ball game, etc., the *referee* is the same as the *umpire*. In some cases *umpire* is legally appointed to decide where *arbitrators* disagree. Thus all these words may have technical senses when used as legal terms.

judgment, judgement (juj'ment), n. [*ME.* *juggement*, *juggement*, < *OF.* *jugement*, *F.* *jugement* = *Pr.* *judamen* = *OSP.* *juzgamiento* = *Pg.* *judgamento* = *It.* *giudicamento*, < *ML.* *judicamentum*, a judgment, < *L.* *judicare*, judge: see *judge*, v.] 1. The faculty of judging.

When one goeth about to prove anything, he must firste invente somewhat to prove his cause, the whiche when he hath dooen, he must use *judgemente* bothe in framyng the same reason so invente, and also to see whether it serveth for the purpose or not. *Sir T. Wilson*, *Rule of Reason* (1552).

Specifically—(a) The intellectual power of perceiving relations between ideas, as the relations of similarity, difference, etc.

When the notice touches upon two or more ideas together, there generally arises another, not compounded or extracted from them, but generated by them—to wit, an idea of comparison, resemblance, identity, difference, relation, distance, number, situation, or other circumstance belonging to them: all which, in metaphysical language, are comprehended under the general term of *judgment*. *A. Tucker*, *Light of Nature*, i. xi.

(b) The power of recognizing the true or just relations between ideas; the power of judging wisely and justly; correct, sound, or acute intellectual perception; understanding; good sense.

And hence perhaps may be given some reason for that common observation that men who have a great deal of wit and prompt memories have not always the clearest *judgment* or deepest reason; for, wit lying most in the assemblage of ideas and putting those together with quickness and variety wherein can be found any resemblance or congruity, thereby to make up pleasant pictures and agreeable visions in the fancy, *judgment* on the contrary lies quite on the other side, in separating carefully, one from another, ideas wherein can be found the least difference, thereby to avoid being misled by similitude, and by affinity to take one thing for another. *Locke*, *Human Understanding*, II. xi. § 2.

To speak therefore of *judgment* as it is in the best poets; they who have the greatest proportion of it want other helps than from it, within. As for example, you would be loth to say that he who is endued with a sound *judgment* has no need of history, geography, or moral philosophy, to write correctly. *Judgment* is indeed the master-workman in a play; but he requires many subordinate hands, many tools to his assistance. *Dryden*, *Dramatick Poesy*.

2. The act of judging. (a) The act of affirming (or denying) a relation (as of similarity or difference) between two ideas.

Judgment . . . is the putting ideas together, or separating them from one another in the mind, when their certain agreement or disagreement is not perceived, but presumed to be so. *Locke*, *Human Understanding*, IV. xiv. 4.

(b) The process of arriving at a conclusion or decision; the determination of a doubtful or debatable matter.

Ye shall do no unrighteousness in *judgment*. Lev. xix. 15.

A Daniel come to *judgement*! yea, a Daniel!
O wise young judge, how I do honour thee!
Shak., *M. of V.*, iv. 1, 223.

3. The product of the mental act of judging; the recognition of a relation between objects; a mental affirmation or proposition; the thought that a given general representation is really applicable to a certain object; the actual consciousness of belief. The Kantian logicians speak of *judgments* where other logicians speak of *propositions*, in order to show that they study thought, and not merely its expression in language.

We find him [Kant] distinguishing two kinds of *judgments*; *judgments* of perception, and *judgments* of experience. The former are *judgments* which merely express a connection of individual experience, and which, therefore, give rise only to a subjective association of ideas. The latter are *judgments* in which the connection is determined by one of the categories, and which therefore express an objective relation of things. *E. Caird*, *Philos. of Kant*, p. 354.

An accurate *judgment* is one which corresponds precisely to the realities represented, or which faithfully expresses the relations of things. *J. Sully*, *Outlines of Psychol.*, p. 403.

4. The decision of a judge, or of one acting as a judge; an authoritative determination; specifically, the judicial decision of a cause in court; adjudication; award; sentence.

Than commaunded the kyngs leodogan that *Jugement* sholde be yoven be the rede of his barouns. *Merlin* (E. E. T. S.), iii. 469.

Another Difference . . . was between the two Archbishops of England, about the Jurisdiction of Canterbury over York, which being referred to the Pope, he gave *Judgment* on Canterbury's Side. *Baker*, *Chronicles*, p. 58.

The Lord and his Spirit puts into the preacher's mouth a *judgment* against oppression, against extortion, against usury, and he utters that *judgment*. *Donne*, *Sermons*, x.

Specifically—(a) the determination of the rights of the parties in a common-law action, as distinguished from a decree in chancery; (b) the determination of the rights of the parties in any action, legal or equitable, under the reformed procedure; (c) the document embodying such determination. When those rights have been conceded, or established by evidence, and it only remains to compel compliance with the judgment, the judgment is called final. If before enforcing the judgment it is necessary to take proceedings to determine the application of those rights—as, for instance, to take an accounting, or to turn lands or chattels into money for the purpose of division—the determination of the rights of the parties first had is an interlocutory judgment or decree, and after such further proceedings have been had the court gives a final judgment or decree, which can be immediately enforced.

5. An opinion formed or put forth; a conclusion drawn from premises; a decision based on observation or belief; an estimate; a view.

By the *judgment* of the most authentic physicians. *B. Jonson*, *Every Man out of his Humour*, iv. 4.

Where blind and naked Ignorance
Delivers brawling judgments, unashamed,
On all things all day long. *Tennyson*, *Merlin and Vivien*.

6. A divine allotment or dispensation; a decree or commandment of God; specifically, an event or experience regarded as a direct manifestation of the divine will, especially of the divine displeasure.

Hence.—(b) In modern practice, the documents (usually the process complaint, answer, verdict or findings and judgment thereon) fastened and folded together, and filed as the record of the judgment.—**Judgment respondent, an interlocutory judgment** requiring the defendant to put in a more substantial defense.—**Interlocutory judgment,** the judgment that certain probabilities require the examination of a given hypothesis.—**To confess judgment,** in a general sense, to acknowledge liability; specifically, to give a formal consent, upon which the clerk of a court or a justice may enter judgment against the consenting party, without the necessity of process or pleading for the bringing of an action.—**To sit in judgment,** to exercise the function of a judge; hence, to assume the right to criticize or judge: usually in an adverse sense.—**Transcendent judgment,** in the Kantian philosophy, a judgment which relates to an object which can never be presented in experience. = *Syn.* 1. *Judgment, Sagacity, Perspicacity;* discrimination, penetration, wisdom, brains. *Judgment,* as compared with *sagacity* and *perspicacity*, is a general word: as, sound judgment in business; good judgment as to cloths. *Sagacity* is a power to discern the real facts of a situation, to see the course that is wisest to avoid failure or achieve success. (See *astute*.) *Sagacity* is especially the word applied to brutes that have a large discernment and a quickness of mind like those of man. *Perspicacity* is essentially the same as *discernment*, except that it is more vividly figurative, suggesting the actual use of the eyes in looking into things. Judicial act, an act involving the exercise of judicial power (which see, below). Hence.—(a) An act of a court or magistrate in deciding a question of right litigated before him or referred by law to his judgment. (b) An act of any public officer involving the exercise of his judgment or discretion on a question affecting the right of any party. Thus, the act of the fiscal officer of a municipality in auditing a claim is usually judicial, but his paying a lawful warrant or order for payment is ministerial. (See *ministerial*.) A judicial act implies deliberation, and therefore, to be done by several jointly, those who are to do it must be together (or under modern statutes a majority after notice to all); while a ministerial act may ordinarily, unless otherwise required by law, be the concurrent act of each separately.

The distinction between a *judicial* and a legislative act is well defined. The one determines what the law is, and what the rights of parties are, with reference to transactions already had; the other prescribes what the law shall be in future cases arising under it.

Justice Stephen J. Field, 99 U. S., 761.

Judicial astrology. See *astrology*.—**Judicial bribery.** See *bribery*.—**Judicial comity,** the deference which courts in any state usually pay to the rules of law maintained in other states or nations, although different from their own, in cases where the persons, property, or transactions in question are within the foreign jurisdiction.

The laws of a state can have no extraterritorial effect; but when a civil controversy arises in the courts of one state as to matters wholly or partly within the territory of another, and the law of the two states differs, and there is contest as to which ought to control the case, the courts often apply the extraterritorial law to extraterritorial persons or property, etc., in the furtherance of justice as between the parties, not as the binding rule of law, but by way of comity.—**Judicial confession.** See *confession*, 1 (2).—**Judicial declaration.** See *declaration*.—**Judicial decision.** See *decision*.—**Judicial evidence.** See *evidence*, 2 (4).—**Judicial factor,** in *Scots law*, a factor or administrator appointed by the Court of Session (sometimes by the sheriff), on special application by petition, setting forth the circumstances which render the appointment necessary. Such factors are usually appointed in cases where a father has died without a settlement, leaving his children in pupilarity, and also where a party has become incapable of managing his own affairs.—**Judicial murder,** the execution of one convicted as criminal legally, but in reality unjust.—**Judicial notice.** See *notice*.

—**Judicial power.** (a) The authority to determine rights of person or property, by arbitrating between adversaries in specific controversies, at the instance of a party thereto. (b) The power conferred upon and exercised by the judiciary or a court as such. (c) A power conferred upon a public officer involving the exercise of judgment and discretion in the determination of questions of right in specific cases affecting the interests of persons or property, as distinguished from ministerial power, or authority to carry out the mandates of judicial power. In the foliose species the leaves are commonly in two rows on the upper side of the stem; sometimes there is a third row of rudimentary ones beneath. The fructification consists of oblong stalked capsules inserted on the stem, which split into valves, ordinarily four, discharging numerous spores and spirally marked elaters. These plants are to be found nearly everywhere in damp soil and on trunks of trees, being especially abundant in humid climates.

Dyauṣ pitar*, lit. 'Jove (Zeus) father': see *Jove*, *Zeus*, *deity*, and *father*.] 1. In *Rom. myth.*, the supreme deity, the parallel of the Greek Zeus, and the embodiment of the might and national dignity of the Romans. The central seat of his cult was the Capitoline Hill at Rome, where he had the title of Optimus Maximus (Best Greatest). He was primarily a divinity of the sky, and hence was considered to be the originator of all atmospheric changes. His weapon was the thunderbolt. He controlled and directed the future, and sacrifices were offered to secure his favor at the beginning of every undertaking. He was also the guardian of property, whether of the state or of individuals. White, the color of the light of day, was sacred to him; hence, white animals were offered to him in sacrifice, his priests wore white caps, his chariot was drawn by four white horses, and the consuls were dressed in white when they sacrificed to him upon assuming office. The eagle was especially consecrated to him. The surviving artistic representations of Jupiter are comparatively late, and betray Greek influence, imitating the type of the Greek Zeus. Also called *Jove*.

2. The brightest of the superior planets, and the largest body of the solar system except the sun itself. Its sidereal period of revolution is 11.86198 Julian years, and its synodical period 899 days. Its mean distance from the sun is about 483,000,000 miles. Its equatorial diameter at its mean distance subtends an angle of 38", so that its real diameter is about one tenth of that of the sun (which subtends 1,922"), and about 11 times that of the earth (the solar parallax being 8".9). Jupiter is flattened at the poles by no less than one seventeenth of its diameter. Its mass is about 1/10 of that of the sun, or 304 times that of the earth, making its mean density only 1.3, that of the earth being taken at 5.5. Gravity at its surface is 24 times that at the earth. The most remarkable feature of the appearance of this planet is the equatorial fascie or bands which cross its disk. These fascie subsist generally for months or even years, but sometimes form in a few hours. They sometimes have a breadth of one sixth of the apparent disk of the planet. There are also spots of much greater permanence. It is, however, probable that no solid matter can be seen, and quite doubtful whether any exists, in the planet. The spots revolve about the axis in 9 hours, 55 minutes, and 35 seconds, but the white clouds in 54 minutes less time. From his photometric observations, Zöllner calculates the albedo of Jupiter to be 0.6, so high a value as to suggest that the planet must be self-luminous. Jupiter has five satellites or moons. Their periods of revolution are as follows: I. 1 d. 18 h. 28 m. 35.945 s.; II. 3 d. 13 h. 17 m. 58.735 s.; III. 7 d. 3 h. 59 m. 33.54 s.; IV. 16 d. 18 h. 5 m. 6.923 s.; V. 11 h. 57 m.

Its fauna is rich and varied. The most highly developed animals in this geological position are certain small mammals. The oldest known bird, possessing also some marked reptilian characters, is found in the Upper Jurassic. The Jurassic series covers a wide area in Europe, and is also of great interest and importance in the Cordilleran region of the United States. The name *Oolite* was originally applied to the rocks of Jurassic age in England by William Smith, by whom the order of succession of this part of the series was first worked out and published. The Jurassic of England includes the Lias as its lower member, and above this the Lower, Middle, and Upper Oolites. In northwestern Germany the Jurassic is divided into the Lower or Black Jura, the Middle or Brown, and the Upper or White. Of these divisions the lower corresponds to the English Lias. The fossil remains of the Jurassic series in the United States are of great interest. Among them is the *Atlantosauros*, a dinosaur, supposed to have been a hundred feet in length and thirty or more in height. The auriferous rocks of the western edge of the North American continent are, at least in large part, of Jurassic age.

jury (jô-ri), *n.*; pl. *juries* (-riz). [Early mod. E. *jurie*, < *ME. jurie*, < *OF. juree*, an oath, a judicial inquest, a jury (*F. jury, juri*, < *E.*), < *ML. jurata*, a jury, a sworn body of men, orig. fem. pp. of *L. jurare* (> *F. jurer* = *Sp. Pg. jurar* = *It. giurare*), swear, bind by an oath, < *jus* (*jur-*), law: see *just*.] 1. A certain number of men selected according to law, and sworn to inquire into or to determine facts concerning a cause or an accusation submitted to them, and to declare the truth according to the evidence adduced. Trial by jury signifies the determination of facts in the administration of civil or criminal justice by the arbitrament of such a body of men, subject to the superintendence of a judge, who directs the proceedings, decides what evidence is proper to be heard before the jury, and determines questions of law. The *juries* in the ordinary courts of justice are *grand juries*, *petty* or *petit* or *common juries*, *special* or *struck juries*, and *sheriff's juries*. Of these, the first and last are not trial *juries* in the proper sense. (See phrases below.) The principle of trial by jury existed in different forms among the ancient Greeks, Ro-

mans, and Germans; but it early fell into general disuse. The existing system gradually grew up under the English common law, from which it passed into American use, but has been only partially adopted in modern times by the nations of continental Europe.

For in good faith I never saw the day yet but that I durst as well trust y^e truth of one judge as of two *juries*.

May in the sworn twelve have a thief or two

Guiltier than him they try. *Shak.*, M. for M., II, 1, 19.

2. A body of men selected to adjudge prizes, etc., at a public exhibition or other competition. Often called *jury of award*.—Coroner's jury, a jury summoned by a coroner to investigate the cause of a death.—Grand jury [i. e. 'large' jury, with reference to the number of members, which is greater than that of a petty or 'small' jury], in law, a body of men designated from time to time from among the people of a community, by authority of law, to inquire what violations of law have been committed therein, and by whom, their function being not to establish guilt, but to ascertain whether there is sufficient ground of suspicion of any person to justify a trial by a petty jury. At common law, and generally by statute, there must be not less than twelve and not more than twenty-three members in a grand jury, and the concurrence of twelve is necessary to find an indictment. (See *indictment*.) In some jurisdictions grand juries are intrusted with some other duties relating to public welfare in their county. There is no grand jury in Scotland.—Juries' (Ireland) Acts, English statutes of 1871 (34 and 35 Vict., c. 65), 1872 (35 and 36 Vict., c. 25), and 1875 (38 and 39 Vict., c. 37), which relate to the qualifications, selection, and summoning of jurors in Ireland.—Jury de medietate linguae (literally, of halfness of language), a jury composed of one half natives and one half aliens, allowed in cases where one of the parties is an alien. It has been generally abolished in the United States, but is still allowed in Kentucky.—Jury of annoyance. See *annoyance*.—Jury of matrons, a jury of 'discreet and lawful women' impaneled to try a question of pregnancy: as where a widow alleges herself to be with child by her late husband, or a woman sentenced to death pleads, in stay of execution, that she is with child.—Mixed jury, a jury of mixed races, particularly a jury including both white men and colored men.—Petty or trial jury.—Sheriff's jury, a jury selected by a sheriff from the list of persons qualified to serve as jurors, and summoned by him to hold inquests, for assessing damages in an action in which the defendant makes no defense, or for ascertaining the mental condition of an alleged lunatic.—Special jury, a jury selected from among men of special qualifications, as merchants or freeholders.—Struck jury, a jury selected by allowing each party alternately to strike off from a list a name not acceptable to him, until the number is reduced to twelve.—To hang a jury. See *hang*.—Trial jury, petty or petty jury, traverse jury, or common jury, a jury formed for the trial of an issue of fact in a civil or criminal action. At common law, both in England and in the United States, a trial jury must consist of twelve, and unanimity is necessary to render a verdict. The constitutional right of trial by jury in the United States implies these conditions. By statute, in cases where the Constitution does not secure this right, juries of six are sometimes allowed, as in justices' courts. By the Constitutions of several States (California, Nevada, and North and South Dakota), three-fourths of a jury may render a verdict in civil actions. According to the law of Scotland, the number of the jury in criminal cases is fifteen; and the decision of a majority determines the verdict. Instead of an absolute verdict of "guilty" or "not guilty," they may return one of "not proven," which frees the accused, but leaves him under a suspicion of guilt. In civil cases the number of the jury is twelve, and the jurors are not required to be unanimously agreed in their verdict. In cases of high treason the jury consists of twelve, and their verdict must be unanimous, as in England.

compounds, *jury-rudder*, *jury-rig*, *jury-rigged*,

to be an abbreviation of *injury*; but this pre-

supposes a form **injury-mast*, a highly improb-

able name for a new mast substituted for one

which has been lost. The accent also makes

an abbr. to *jury*-improbable. More improb-

able still are the etymologies which refer the

word to Dan. *kiöre*, a driving, < *kiöre* (= Sw.

or to journey ("a *journiere* mast, i. e. a mast

Jussieu (jus-i-ō'ä), *n.* [NL. (Linnaeus), named

after Bernard de Jussieu, founder of the natural

system of botany developed later by his

nephew. See *Jussieu*.] A genus of plants of

the natural order *Onagraceæ*, containing about

40 species, mainly herbs, inhabiting swamps

and ponds, mostly in tropical and subtropical

regions. The adherent calyx-tube is elongated, but not

produced beyond the 4-celled ovary. There are from 4 to

6 entire or 2-lobed petals, with twice as many stamens.

The leaves are alternate, and the yellow or white flowers

are axillary and solitary. Several species are grown in

collections, but none is conspicuous for its flowers or me-

dical properties. *J. decurrens* and *J. repens* are natives

of the United States; the latter also grows in the West-

Indies. The genus is sometimes very properly called *Jussieu*,

Jussieu, *Jussieu*, *Jussieu*.

Jussieu (jus-i-ō'an), *a.* [< *Jussieu* (see def.)

+ *-an*.] Of or pertaining to one of the French

botanists Jussieu, especially Antoine Laurent

de Jussieu (1748-1836).—Jussieuian system, in

bot., the natural (as contrasted with the artificial or Lin-

naean) system of classification, promulgated by A. L. de

Jussieu in 1759 in his "Genera of Plants disposed accord-

ing to Natural Orders." His uncle, Bernard de Jussieu

(1699-1776), had proceeded in the same direction. To the

nephew more than any one else is due the received clas-

sification of genera under orders based upon proper char-

acters. Of these he founded one hundred, within which he

included nearly all known genera. His primary division

of the vegetable kingdom was into *Acotyledones* (the *Cryp-*

togamia of Linnaeus), *Monocotyledones*, and *Dicotyledones*.

Subordinate divisions among flowering plants were based

upon the position of the stamens. His system has been

improved by A. P. de Candolle and many later workers.

E. also *giust* (after It.); < ME. *juste*, < OF. *joste*, *jouste* (*F. joute*), also *justee* = It. *giostra* (for **giosta*), a just; from the verb.] A military contest or spectacle in which two adversaries attacked each other with blunted lances, rarely with sharp weapons as in war; a knightly tilt. The just was sometimes held at the barrier; that is, the charging knights were separated by a solid structure of wood, which each kept on his left hand, the lance being held diagonally across the neck of the horse. The shield was hung from the neck, leaving the left hand free to manage the horse and the right to direct the lance. The shock of the lance was sometimes received on the helmet, and on this account the tilting-helmet had commonly the openings for air on the right side. From the beginning of the fourteenth century the armor for the just differed from the armor for war, and became more and more heavy and unwieldy, the tilter being almost immovable in his saddle, in which he was secured by high pommel and cantle, and often by a garde-cuisse completely covering the left thigh and leg. The sport was usually declared to be in honor of one or more ladies who presided as judges and awarded the prizes.

Lift up thy selfe out of the lowly dust,
And sing of bloody Mars, of wars, of giusts.

[U. S.] = *Syn. 1*. *Right Justice, Equity, Law; Justness, Justice. Right* is the standard word for what ought to be. *Justice* and *equity* are essentially the same, expressing the working out of the principles of right under law, but law is often contrary to justice or equity: hence the occasional remark, "That may be law, but it is not justice." Law in such a case means the interpretation of written law by the courts. A court of equity deals with and corrects the injustice of the working of the law. *Equity* more expressively represents the idea of fairness, and *justice* that of sacred rights. (See *just¹* and *honesty*.) *Justness* has a field of meaning peculiar to itself, by which we speak of the *justness* of observations, criticisms, etc. — that is, their conformity to admitted principles. As to conformity to right, we use *justice* for the abstract quality, *justice* of the person, and *justness* of the thing. We speak of the *justness* of a cause, a claim, a plea, etc.

The love of books is a love which requires no *justification*, apology, or defense.

Langford, Praise of Books, Prelim. Essay.

Specifically—2. In *law*: (a) The showing of a sufficient reason in court why a defendant did what he is called to answer: as, a plea in *justification*.

Philadelphia Times, April 10, 1886.

3. In *theol.*, the act by which the soul is reconciled to God. According to Roman Catholic authority, justification is an act by which God imparts his own character to the believer, making him truly just or righteous. According to the common Protestant doctrine, it is a forensic act by which, on certain conditions, God treats as just or righteous one who is not personally worthy of such treatment. In this sense it is nearly equivalent to the forgiveness of sins.

Justification . . . is not remission of sins merely, but also the sanctification and renewal of the inner man, through the voluntary reception of the grace, and of the gifts, whereby man of unjust becomes just, and of an enemy a friend, that so he may be an heir according to hope of life everlasting.

Canons and Decrees of the Council of Trent, quoted in [Schaff's] "Creeds of Christendom," II. 95.

Justification is thus a forensic term; it is equivalent to the remission of sins. To justify signifies not to make the offender righteous, but to treat him as if he were righteous, to deliver him from the accusation of the law by the bestowal of a pardon.

G. P. Fisher, Hist. Reformation, p. 461.

4. The act of adjusting or making exact; the act of fitting together, as the parts of anything; as, the *justification* of lines or types, in printing.

Are we to seek here for the *justification* of the frontier which struck us as artificial and needless?

E. A. Freeman, Venice, p. 44.

When he [the printer] comes to the end of his line, and finds that he has a syllable or word which will not fill out the measure, he has to perform a task which requires considerable care and taste. This is called *justification*.

Ure, Dict., III. 644.

jute² (jöt), *n.* [Beng. *jüt*, the fibers of the plant *Corchorus*, also the plant itself, Malayalam *jat*, < Skt. *jatā* (also *juta*), matted hair (as worn by Shiva or Hindu ascetics), also the fibrous roots of a tree (as of the banyan).] 1. A plant of the fiber-producing genus *Corchorus*, natural order *Tiliaceae*; chiefly, one of the two species *C. capsularis* and *C. olitorius*, which alone furnish the jute-fiber of commerce. The latter is called *Jews'-mallow*, a name also occasionally given to the former. *C. capsularis* is the larger, and has

a, flower; b, seed; c, fruit of *C. ziziquius*.

short globular pods, while those of *C. olitorius* are elongated and cylindrical; but there is no clear difference in the quality of their product. The two species are native and cultivated in Bengal, whence comes the great mass of the jute of commerce, 60,000 tons being exported per year. Jute likes a warm, moist climate. It has been introduced into Egypt, and into the southern United States, where its success appears to be hindered only by the want of a sufficiently cheap means of separating the fiber.

2. The fiber of this plant. It is obtained by maceration from the inner bark. It is of fair tenacity, glossy, and susceptible of so fine division as to mix well with silk, and can take on a bright and permanent coloring. Hitherto, however, its commercial use has been in the manufacture of coarse fabrics, such as gunny-bags, for which it is consumed in vast quantities. It is of inferior value for ropes, not enduring moisture well. The refuse makes good paper. Dundee, in Scotland, is the great seat of jute-manufacture.—**American jute** (improperly so called), the velvetleaf, *Abutilon Avicennae*, belonging to the *Malvaceae*; introduced from India, and now too common as a cornfield weed. Its fiber is pronounced equal to jute, and its economical importance seems to depend on the adaptation of suitable machinery.—**Bastard jute**, *Hibiscus cannabinus*, the fiber of which is inferior both to jute and sunn-hemp, and with the better *H. esculentus*, is used to adulterate jute.—**Jute-butts** or **-cuttings**, the woody stump of the jute-plant, the fiber of which is used for various purposes.

1. The eleventh letter and eighth consonant of the English alphabet; the eleventh character also of the Phœnician alphabet, from which it has come to us through the Latin and Greek. The comparative scheme of forms, Phœnician with its descendants and its claimed originals (see *A*), is as follows:

K was little used in classical Latin, its office having been transferred to *C* (as is explained under *C*); hence it is not common in most alphabets derived from the Latin, as Italian and French. It was scarcely used in Anglo-Saxon, the *k*-sound being regularly represented by *c*, of which *k* was only an occasional variant; but it became common in early Middle English, from the thirteenth century, and gained rapidly in frequency, being needed to represent the *k*-sound where the *c* would be ambiguous, owing to the assimilation of *c* before certain vowels. (See *C*, *ch*.) It is now the regular symbol for the sound it denotes in all the Teutonic languages, except English. In the modern English spelling of words of Anglo-Saxon, Romance, or Latin origin it occurs for this sound before *e* and *i*, *c* being used before other vowels and before consonants. In foreign words not of Romance or Latin origin *k* is the usual initial symbol for the sound. Medially and finally, the sound is denoted in English by *ck*, as in *back*, *bicker*, etc. *K* has no variety of pronunciation in English, being everywhere the surd or breathed correspondent to the sonant or voiced *g* (hard). It is called a guttural, or, better, a back-palatal, being the audible result of a breach of contact between the upper surface of the back part of the tongue and the opposite surface of the palate; it is related to *g* (hard) and *ng* as *t* is related to *d* and *n*, and *p* to *b* and *m*. It is, however, now silent before *n*, in words like *knife*, *knight*; and, while itself no longer doubled in English words, it is used with *c* as a substitute for double *c* or double *k*, as in *sick*, *suck*. In words belonging to the Teutonic part of our language, the *k*-sound represents to a large extent a more original *g*-sound, as in *kin*, answering to Latin *gens*, Greek *γένος* (Sanskrit *jāna*). Owing to the variable English transliteration of Oriental words (Arabic, Hebrew, Hindustani, Persian, Turkish, etc.), *k* (or *c*) may represent any one of several different kinds of *k*-sounds, more precisely represented (as in the etymologies of this dictionary) by *k*, *kh*, *q*, *gh*, *h*, etc. Such words are preferably entered under the form nearest the original; but usage is too arbitrary and various to be brought under any rule.

This stone is an irregular oval about seven inches in diameter, and is composed of about a dozen smaller stones of different shapes and sizes. It is the point toward which all Mohammedans face during their devotions. The Kaaba is opened to worshippers twice or three times a year, but only the faithful are permitted to approach it.

kaleidoscope (ka-lī'dō-skōp), *n.* [F. *kaleido-
scope* (< E.); irreg. < Gr. *kalós*, beautiful, + *eidos*,
form, + *σκοπεω*, view.] An optical instru-
ment creating and exhibiting, by reflection,
a variety of beautiful colors and symmetrical
forms. In its simplest form the instrument consists of
a tube containing two reflecting surfaces inclined toward
each other at any angle which is an aliquot part of 360°. A
clear eye-glass is placed immediately against one end of
the mirrors and a similar glass at their other end; the
tube is continued a little beyond this second glass, and the
termination is closed by a disk of ground glass. In the cell
thus formed are placed beads, pieces of colored glass, or
other small, bright-colored, diaphanous objects, and the
changing of their positions by rotating the tube pro-
duces, by the repeated reflection in the mirrors, different
symmetrical figures. The polyangular kaleidoscope multi-
plies the effect by having three or four mirrors; a larger
number destroys the symmetry of combination. Besides
the use of the kaleidoscope as a toy, it serves the practical
purpose of furnishing an endless variety of patterns for
decorative work. Sir David Brewster invented the instru-
ment about 1815, although the idea of it had been vaguely
suggested before. He also made it applicable to distant
objects by replacing the object-box at the outer end with
a double-convex lens, controlled by an adjusting-screw.—

kaleidoscope mounted on a stand, with a wheel to regu-
late its adjustment: so called because furnished with very

corolla and ten hypogynous stamens with elon-
gated filaments. The anthers have the peculiarity
(though free in the early bud) of becoming embedded in
specialized pits or pockets of the corolla as it expands,
the filaments bending over and acquiring tension, and
finally straightening elastically, withdrawing the anthers
suddenly and projecting the pollen to some distance over
adjacent flowers. The plants are for the most part hand-
some evergreen shrubs with shining leaves and showy
flowers in corymbs. There are 6 species, one of which
grows in the West Indies, and one extends to the Rocky
Mountains and California, the remainder being confined
to eastern North America. *K. latifolia*, the American
laurel, also called *calico-bush* from the color of its flowers,

can shrubs, and was proposed by Darlington as the na-
tional emblem. It is a large shrub, often from 10 to
20 feet in height, with ample shining leaves and a pro-
fusion of very showy flowers varying from nearly white
to deep pink. The stems are crooked and straggling,
the bark brown and scaly, and the wood very hard and
useful for various purposes. *K. angustifolia*, the sheep-
laurel, lambkill, or wicky, is a smaller shrub with bright
crimson or rose-colored flowers, common in New Eng-
land, and ranging from Hudson's Bay to Georgia. It is
believed to poison sheep when the deep snows of winter
drive them to the extremity of eating it. *K. glauca*, the

that ranges across the continent. It is a low straggling
bush, with the leaves whitened underneath, and lilac-purple
flowers.

A large marsupial mammal of Australia, *Macropus giganteus*; by extension, any herbivorous and saltatorial marsupial of the family *Macropodidae* (which see for technical characters). The great kangaroo, the first Australian species of this large family to become known to Europeans, was discovered by Cook in 1770. The male stands 6 or 7 feet high; the female is a third smaller. The hinder parts of the animal enormously preponderate over the fore parts; the thighs and tail are very muscular, the lower leg and the tail very long. The second and third digits are much reduced, the weight of the body falling chiefly on the fourth and fifth. The fore limbs are very small, used chiefly for prehension, and not in locomotion; during the flying leaps the animal makes, said to be from 10 to 20 and even 30 feet in extent, they are closely applied to the breast. The head and neck are slender, the ears high. The general color is yellowish brown, darker above and paler below. The front teeth are fitted for nipping herbage; the stomach is long and sacculated; and there is a large cæcum. In their whole structure and economy the kangaroos represent ruminants in the Australian, Austro-Malayan, and Papuan regions. They are gregarious, inoffensive, and timid, but when brought to bay prove formidable antagonists, using the claws of the hind feet with great effect. They are killed by being closed in upon and

knocked down with clubs, or driven into ambush and shot like deer. There are many species, 23 of the genus *Macropus*, 6 of *Petrogale*, and 3 of the genus *Onychogalea*, in which the tail ends in a kind of nail. They inhabit not only Australia and Tasmania, but New Guinea, New Ireland, the Aru Islands, and other islands. A large num-

Hare-kangaroos or kangaroo-hares belong to the genus *Lagorchestes*. (See cut under hare-kangaroo.) A peculiar type of kangaroo, inhabiting New Guinea and Misol, is the genus *Dorcopsis*. (See cut under *Dorcopsis*.) Kangaroo-rats, potorooes, or bettongs are small animals constituting the subfamily *Hypsiprymninae*.

This animal is called by the natives *kangaroo*. Cook's Voyages, quoted in N. and Q., 6th ser., VI. 58.

Kantian (kan'ti-an), *a.* and *n.* [Kant (see def.) + *-ian*.] 1. *a.* Of or belonging to Immanuel Kant, the great German philosopher (1724-1804), or to his system of philosophy.

The ultimate decision . . . as to the truth of the Kantian Criticism of Pure Reason must turn upon the opposition of perception and conception, as factors which reciprocally imply, and yet exclude, each other.

E. Caird, Philos. of Kant, p. 666.

II. *n.* A follower of Kant; a Kantist.

Kantianism (kan'ti-an-izm), *n.* [G. *Kantianismus*; but *Kantism* is a product of a more recent fashion in word-formation.] The doctrine of the German philosopher Immanuel Kant (1724-1804), one of the most influential of metaphysicians. His leading work, published in 1781 (second edition in 1787), is the "Kritik der reinen Vernunft," or "Critique of the Pure Reason" (the word *critic*, borrowed from Locke, being the name of a science analogous to logic). His fundamental position is that just as blue and red are said to be "imputed" qualities, which do not exist in the outward things themselves, but are only the modes in which the things affect the eye, so every attribute is merely a mode in which the mind is affected, and has no application to a thing in itself. This is true even of such predicates as existence and possibility, and equally so of non-existence and impossibility. In short, a thing in itself is absolutely unthinkable. But just as it is quite true that one thing is blue and another red, in the sense of really so affecting the eye, so Kant does not attack the real externality of matters of fact, but only that of the forms under which alone they can be apprehended by us. The ideas which the mind thus imports into knowledge are of two kinds — those which are presented in sensation, and those which are introduced in the process of thinking. The first kind, that of the forms of intuition, consists of the ideas of space and time. Space is the form under which alone we can have external perceptions. Time is that in which all our inward experience must clothe itself, and thus our outward sensations, too, when they come to be reproduced in reflection. Thought, on the other hand, is obliged to assume the forms of propositions, and thus arise twelve general conceptions (categories). For as a proposition is either universal, particular, or singular, so the object of thought must have quantity; as propositions are either affirmative, negative, or infinitive, so the object of thought must have degree of reality; as propositions are either categorical, hypothetical, or disjunctive, so the object of

thought must be either a substance with attributes inhering in it, or a cause with its effect, or mutually reacting elements; and, finally, as a proposition is either contingent, necessary, or problematical, so the object of thought must possess corresponding modes of being. In attributing an unchangeable character to these conceptions, Kant is profoundly hostile to the spirit of empiricism; but in limiting human knowledge strictly to objects of possible experience, he seemed to strike a severe blow to metaphysics. Religious ideas are, however, to be admitted as regulative principles. Kant is a severe moralist, his rule being "Act so that the maxim of thy will can likewise be valid as a principle of universal legislation."

Through every day of the season half the population of the entire village go and come to the summit of the bluff which overhangs it, where they peer down for hours at a time upon the methods and evolutions of the *kantickie* below, the seals themselves looking up with intelligent appreciation of the fact that, though they were in the hands of man, yet he is wise enough not to disturb them there as they rest.

kantikoy, **canticoy** (kan'ti-koi), *v. i.* [Also *cantico*, etc., in the earliest form *kintekaege*; from the noun.] To dance as an act of worship, or in festivity: said of American Indians.
